- Predictive analysis (Classification)

- **Summary of all results**

- EDA results
- Interactive analytics
- Predictive analysis

Introduction

- **Background**

Our project is part of a big learning journey – the final course of the IBM Data Science series. Think of us as the brainy folks at SpaceY, a new company aiming to launch rockets just like SpaceX. In this project, we will use the cool methodologies from data science to help SpaceY make smart choices when it comes to sending rockets into space, and maybe even outbid the big guys at SpaceX.

- **Business Problem**

Here's the scoop: SpaceX is the big name in space because they figured out how to send rockets up without breaking the bank. They say it costs about 62 million dollars to launch their Falcon 9, which is way cheaper than what other companies charge. They save a bunch by reusing the first part of the rocket. Normally, that part alone could set you back over 15 million dollars, not even counting the money spent developing it. But sometimes, SpaceX has to let that first part go – maybe the satellite they're carrying is super heavy, or they need to send it to a special place in space. When that happens, it's bye-bye savings. So, we're on a mission to guess if that rocket part is going to make it back safely or not. Getting this right could mean big savings, and that's a number any shareholder would like to see.

Section 1

Methodology

Methodology

- Data collection methodology:
 - SpaceX Open Source Rest API
 - Web Scraping from Wikipedia page ‘List of Falcon 9 and Falcon Heavy Launches’
- Perform data wrangling
 - Transforming categorical data using One Hot Encoding for machine learning algorithms and removing any empty or unnecessary information from the dataset.
- Perform exploratory data analysis (EDA) using visualization and SQL
- Perform interactive visual analytics using Folium and Plotly Dash
- Perform predictive analysis using classification models
 - Logistic Regression, K-Nearest Neighbors, Support Vector Machines, and Decision Tree models have been developed to determine the most effective classification method.

Data Collection

The data sets are collected using 2 methods:

1) Request to the SpaceX API

- Gathered SpaceX's past launch data via their open-source API.
- Retrieved and processed this data with GET request.
- Ensured the data included only Falcon 9 launches.
- Filled in missing payload weights from secret missions with average values.

2) Web Scraping

- Requested past Falcon 9 and Falcon Heavy launch data from Wikipedia's relevant page.
- Accessed the Falcon 9 Launch page via its direct Wikipedia link.
- Extracted all the column names from the HTML table.
- Parsed and transformed the table into a Pandas data frame suitable for analysis.

Data Collection – SpaceX API

Requested and parsed the data from SpaceX API using GET request

Task 1: Request and parse the SpaceX launch data using the GET request

To make the requested JSON results more consistent, we will use the following static response object for this project:

```
[23]: static_json_url='https://sf-courses-data.s3.us.cloud-object-storage.appdomain.cloud/IBM-DS0321EN-SkillsNetwork/datas...  
We should see that the request was successful with the 200 status response code  
[24]: response=requests.get(static_json_url)  
[25]: response.status_code  
[25]: 200  
Now we decode the response content as a Json using .json() and turn it into a Pandas dataframe using .json_normalize()  
[26]: # Use json_normalize method to convert the json result into a dataframe  
data=pd.json_normalize(response.json())  
Using the dataframe data print the first 5 rows  
[27]: # Get the head of the dataframe  
data.head()  
[27]: static_fire_date_utc static_fire_date_unix tbd net window rocket success details crew ships
```

Stored the data and constructed the dataset into a new dictionary with relative columns

Then, we need to create a Pandas data frame from the dictionary launch_dict.

```
[37]: # Create a data from launch_dict  
data2 = pd.DataFrame(launch_dict)  
Show the summary of the dataframe  
[38]: # Show the head of the dataframe  
data2.head()  
[38]: FlightNumber Date BoosterVersion PayloadMass Orbit LaunchSite Outcome Flights GridFins Reused Legs LandingP  
0 1 2006-03-24 Falcon 1 20.0 LEO Kwajalein Atoll None None 1 False False False No  
1 2 2007-03-21 Falcon 1 NaN LEO Kwajalein Atoll None None 1 False False False No  
2 4 2008-09-28 Falcon 1 165.0 LEO Kwajalein Atoll None None 1 False False False No  
3 5 2009-07-13 Falcon 1 200.0 LEO Kwajalein Atoll None None 1 False False False No  
4 6 2010-06-04 Falcon 9 NaN LEO CCSFS SLC 40 None None 1 False False False No
```

Filtered the dataframe to only include Falcon 9 launches needed for the project analysis

Task 2: Filter the dataframe to only include Falcon 9 launches

Finally we will remove the Falcon 1 launches keeping only the Falcon 9 launches. Filter the data dataframe using the BoosterVersion column to only keep the Falcon 9 launches. Save the filtered data to a new dataframe called data_falcon9.

```
[39]: # Hint data['BoosterVersion']!='Falcon 1'  
data_falcon9 = data2[data2['BoosterVersion']!='Falcon 1']
```

Now that we have removed some values we should reset the FlightNumber column

```
[40]: data_falcon9.loc[:, 'FlightNumber'] = list(range(1, data_falcon9.shape[0]+1))  
data_falcon9
```

/home/jupyterlab/conda/envs/python/lib/python3.7/site-packages/pandas/core/indexing.py:1773: SettingWithCopyWarning:
A value is trying to be set on a copy of a slice from a DataFrame.
Try using .loc[row_indexer,col_indexer] = value instead

See the caveats in the documentation: https://pandas.pydata.org/pandas-docs/stable/user_guide/indexing.html#returning-a-view-versus-a-copy
self._setitem_single_column(ilocs[0], value, pi)

FlightNumber	Date	BoosterVersion	PayloadMass	Orbit	LaunchSite	Outcome	Flights	GridFins	Reused	Legs
4	1 2010-06-04	Falcon 9	NaN	LEO	CCSFS SLC 40	None None	1	False	False	False
5	2 2012-05-22	Falcon 9	525.0	LEO	CCSFS SLC 40	None None	1	False	False	False

Cleaned the data and removed missing values of PayLoadMass

Task 3: Dealing with Missing Values

Calculate below the mean for the PayloadMass using the .mean(). Then use the mean and the .replace() function to replace np.nan values in the data with the mean you calculated.

```
[42]: # Calculate the mean value of PayloadMass column  
payload_mean = data_falcon9['PayloadMass'].mean()  
# Replace the np.nan values with its mean value  
data_falcon9['PayloadMass'] = data_falcon9['PayloadMass'].replace(np.nan, payload_mean)  
data_falcon9.isnull().sum()  
data_falcon9.to_csv('dataset_part_1.csv', index=False)
```

/home/jupyterlab/conda/envs/python/lib/python3.7/site-packages/ipykernel_launcher.py:4: SettingWithCopyWarning:
A value is trying to be set on a copy of a slice from a DataFrame.
Try using .loc[row_indexer,col_indexer] = value instead

See the caveats in the documentation: https://pandas.pydata.org/pandas-docs/stable/user_guide/indexing.html#returning-a-view-versus-a-copy
after removing the cwd from sys.path.

Data Collection - Scraping

Requested data from Wikipedia using HTTP GET request and BeautifulSoup

TASK 1: Request the Falcon9 Launch Wiki page from its URL

First, let's perform an HTTP GET method to request the Falcon9 Launch HTML page, as an HTTP response.

```
[22]: # use requests.get() method with the provided static_url
# assign the response to a object
response = requests.get(static_url)
print(response)
```

<Response [200]>

Create a `BeautifulSoup` object from the HTML `response`

```
[23]: # Use BeautifulSoup() to create a BeautifulSoup object from a response text content
soup = BeautifulSoup(response.text)
```

Print the page title to verify if the `BeautifulSoup` object was created properly

```
[24]: # Use soup.title attribute
page_title = soup.title.string
print(page_title)
```

List of Falcon 9 and Falcon Heavy launches - Wikipedia

Extracted all column/variable names from the HTML table header

TASK 2: Extract all column/variable names from the HTML table header

Next, we want to collect all relevant column names from the HTML table header

Let's try to find all tables on the wiki page first. If you need to refresh your memory about `BeautifulSoup`, please check the external reference link towards the end of this lab

```
[25]: # Use the find_all function in the BeautifulSoup object, with element type `table`
# Assign the result to a list called `html_tables`
html_tables = soup.find_all('table')
```

Starting from the third table is our target table contains the actual launch records.

```
[26]: # Let's print the third table and check its content
first_launch_table = html_tables[2]
print(first_launch_table)

```

Cleaned the column data, created an empty dictionary with extracted columns and appended the column names

After you have fill in the parsed launch record values into `launch_dict`, you can create a dataframe from it.

```
[32]: df= pd.DataFrame({ key:pd.Series(value) for key, value in launch_dict.items() })
df= pd.DataFrame(launch_dict)
df
```

	Flight No.	Launch site	Payload	Payload mass	Orbit	Customer	Launch outcome	Version Booster	Booster landing	Date	Time

Data Wrangling

Calculated the number of launches of each site

TASK 1: Calculate the number of launches on each site

The data contains several Space X launch facilities: **Cape Canaveral Space Launch Complex 40 VAFB SLC 4E**, Vandenberg Air Force Base Space Launch Complex 4E (**SLC-4E**), Kennedy Space Center Launch Complex 39A **KSC LC 39A**. The location of each Launch is placed in the column `LaunchSite`.

Next, let's see the number of launches for each site.

Use the method `.value_counts()` on the column `LaunchSite` to determine the number of launches on each site:

```
[10]: # Apply value_counts() on column LaunchSite
df['LaunchSite'].value_counts()

[10]: LaunchSite
CCAFS SLC 40    55
KSC LC 39A     22
VAFB SLC 4E     13
Name: count, dtype: int64
```

Calculated the number and occurrence of each orbit and its mission outcome

TASK 2: Calculate the number and occurrence of each orbit

Use the method `.value_counts()` to determine the number and occurrence of each orbit in the column `Orbit`

```
[11]: # Apply value_counts on Orbit column
df['Orbit'].value_counts()

[11]: Orbit
GTO      27
ISS      21
VLEO     14
PO       9
LEO      7
SSO      5
MEO      3
HEO      1
ES-L1    1
SO       1
GEO      1
Name: count, dtype: int64
```

Calculated the number and occurrence of each orbit and its mission outcome

TASK 3: Calculate the number and occurrence of mission outcome of the orbits

Use the method `.value_counts()` on the column `Outcome` to determine the number of `landing_outcomes`. Then assign it to a variable `landing_outcomes`.

```
[12]: # Landing_outcomes = values on Outcome column
landing_outcomes = df['Outcome'].value_counts()
landing_outcomes

[12]: Outcome
True ASDS      41
None None      19
True RTLS      14
False ASDS      6
True Ocean      5
False Ocean      2
None ASDS      2
False RTLS      1
Name: count, dtype: int64
```

Created a landing outcome label from Outcome column

▼ TASK 4: Create a landing outcome label from Outcome column

Using the `Outcome`, create a list where the element is zero if the corresponding row in `Outcome` is in the set `bad_outcome`; otherwise, it's one. Then assign it to the variable `landing_class`:

```
[15]: # Landing_class = 0 if bad_outcome
# landing_class = 1 otherwise
landing_class = df['Outcome'].map(lambda x: 0 if x in bad_outcomes else 1)
```

This variable will represent the classification variable that represents the outcome of each launch. If the value is zero, the first stage did not land successfully; one means the first stage landed successfully.

```
[16]: df[['Class']] = landing_class
df[['Class']].head(8)
```

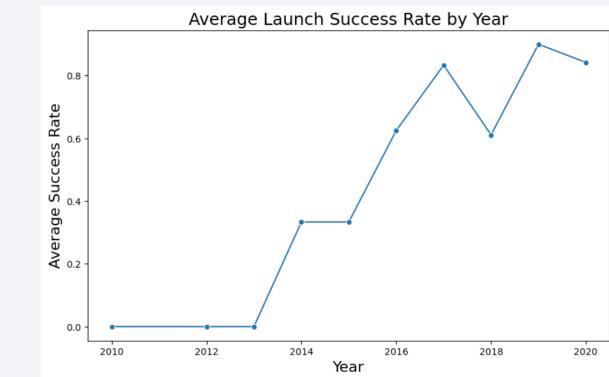

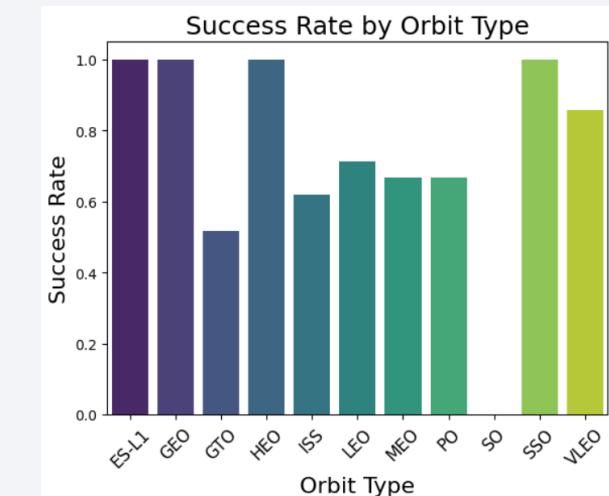

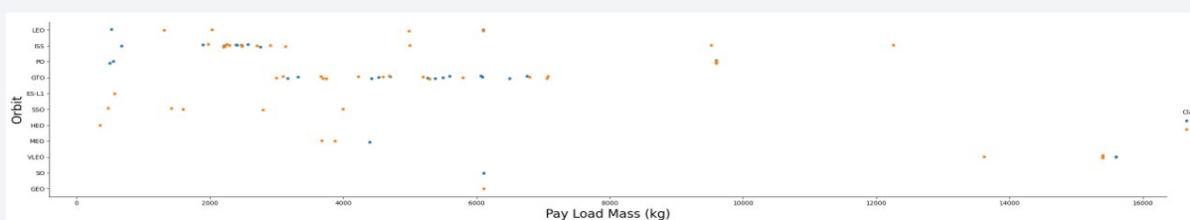

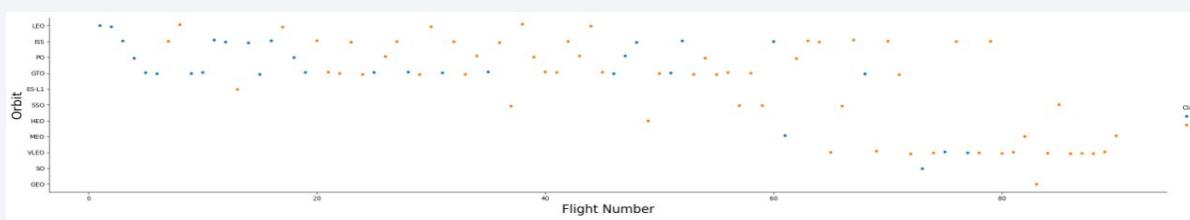

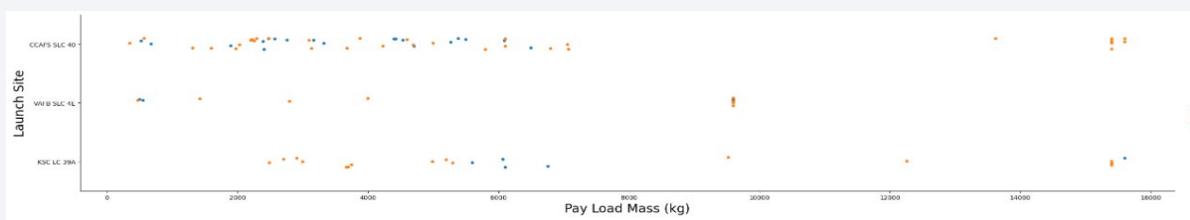

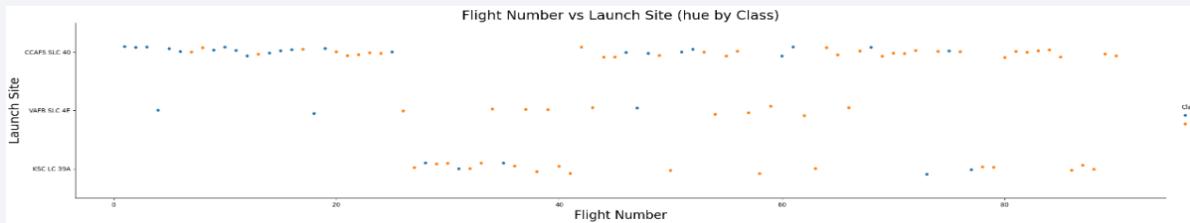

Class
0
1
2
3
4
5

EDA with Data Visualization

We explored the data by visualizing the relationship between flight number and launch Site, payload and launch site, success rate of each orbit type, flight number and orbit type, the launch success yearly trend.

Scatter point charts are used to visualize the relationship between (1) Flight Number and Launch Site, (2) Payload and Launch Site, (3) Flight Number and Orbit type, (4) Payload and Orbit type

Bar chart was used to visualize the relationship between success rate of each orbit type; Line chart was used to visualize the launch success yearly trend

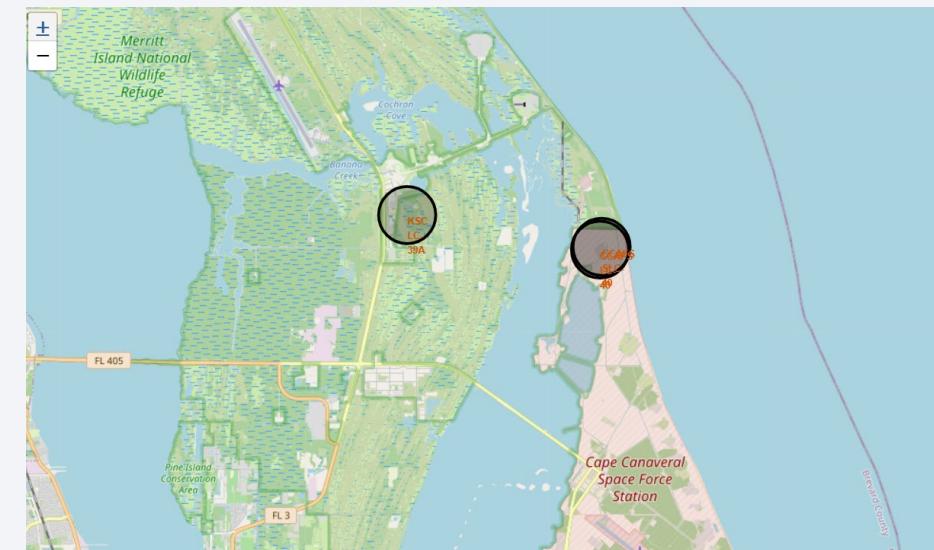

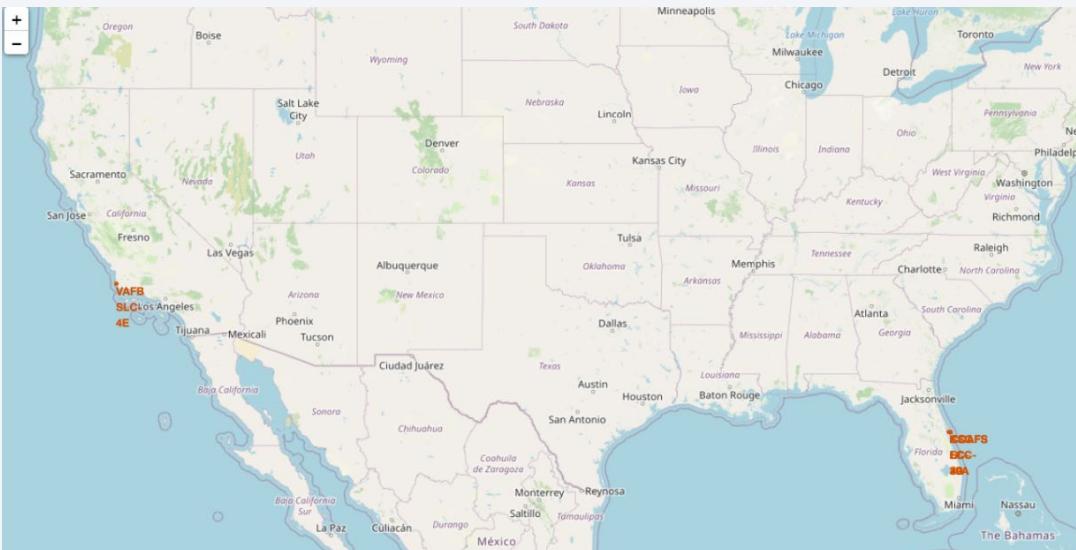

EDA with SQL

SQL queries are performed to:

1. Display the names of the unique launch sites in the space mission
2. Display 5 records where launch sites begin with the string 'CCA'
3. Display the total payload mass carried by boosters launched by NASA (CRS)
4. Display average payload mass carried by booster version F9 v1.1
5. List the date when the first successful landing outcome in ground pad was achieved.
6. List the names of the boosters which have success in drone ship and have payload mass greater than 4000 but less than 6000
7. List the total number of successful and failure mission outcomes
8. List the names of the booster versions which have carried the maximum payload mass using a subquery
9. List the records which will display the month names, failure landing outcomes in drone ship ,booster versions, launch site for the months in year 2015.
10. Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad)) between the date 2010-06-04 and 2017-03-20, in descending order.

Build an Interactive Map with Folium

- We marked all launch sites, and added map objects such as markers, circles, lines to mark the success or failure of launches for each site on the folium map.
- We assigned the feature launch outcomes (failure or success) to class 0 and 1.i.e., 0 for failure, and 1 for success.
- Using the color-labeled marker clusters, we identified which launch sites have relatively high success rate.
- We calculated the distances between a launch site to its proximities. We answered some question for instance:
 - Are launch sites near railways, highways and coastlines.
 - Do launch sites keep certain distance away from cities.

Build a Dashboard with Plotly Dash

- We built an interactive dashboard with Plotly dash
- We plotted pie charts showing the total launches by a certain sites
- We plotted scatter graph showing the relationship with Outcome and Payload Mass (Kg) for the different booster version.

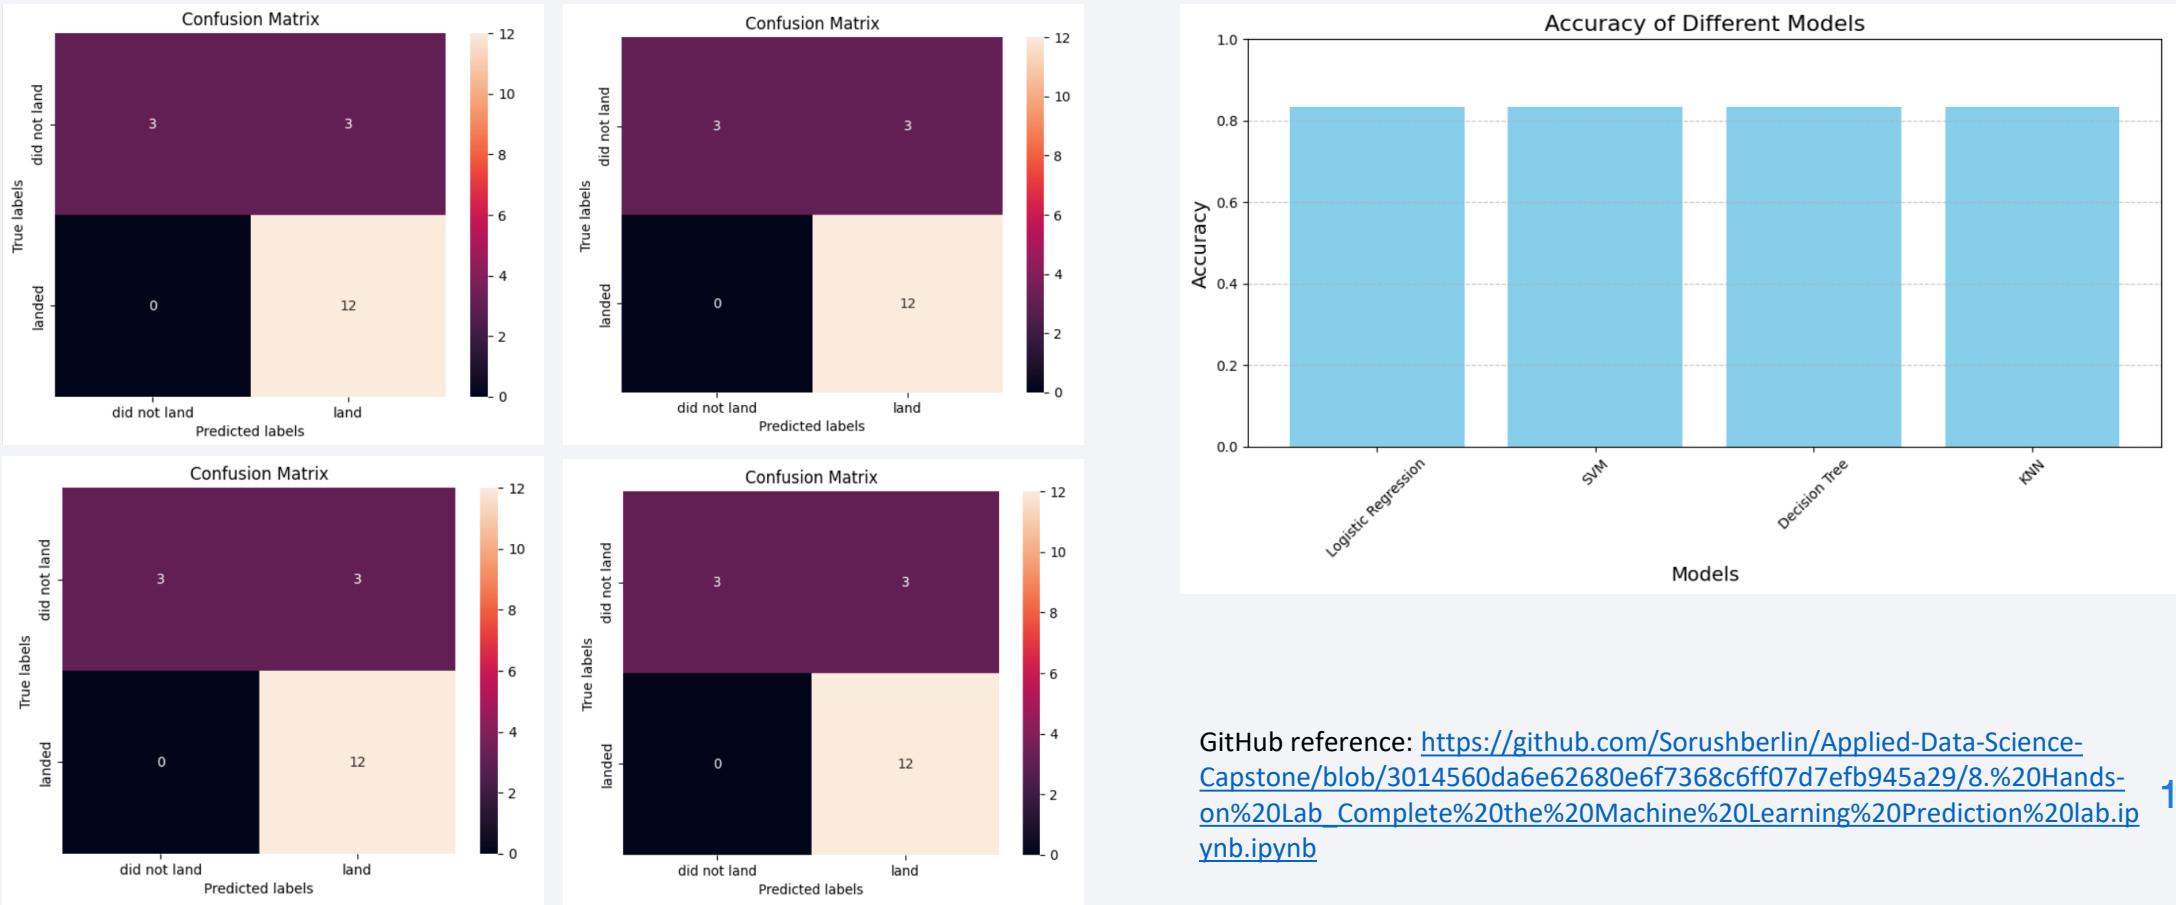

14

GitHub reference: https://github.com/Sorushberlin/Applied-Data-Science-Capstone/blob/bb797250e1253841416e0e005eadf57a07c66d01/7.%20Hands-on%20Lab_Build%20an%20Interactive%20Dashboard%20with%20Plotly%20Dash_spacex_dash_app.py

Predictive Analysis (Classification)

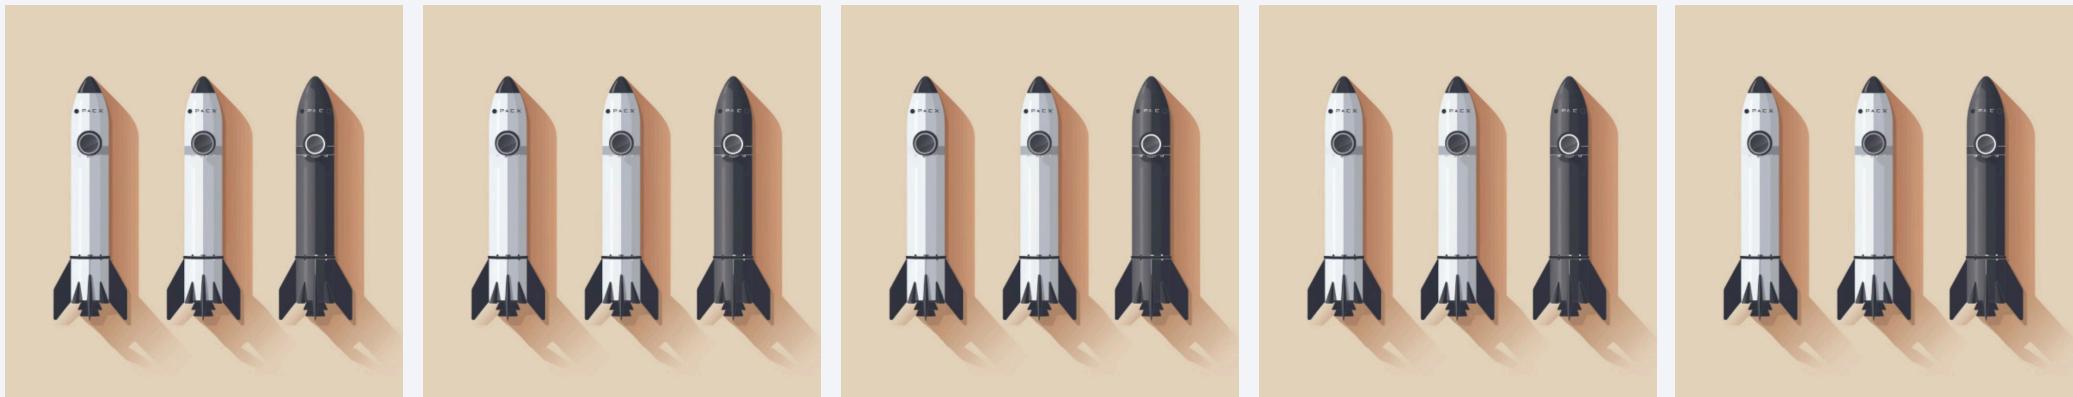

LR, SVM, Decision Tree and KNN objects are created and fit with GridSearchCV object to find the best parameters, then the models are trained on the training set.

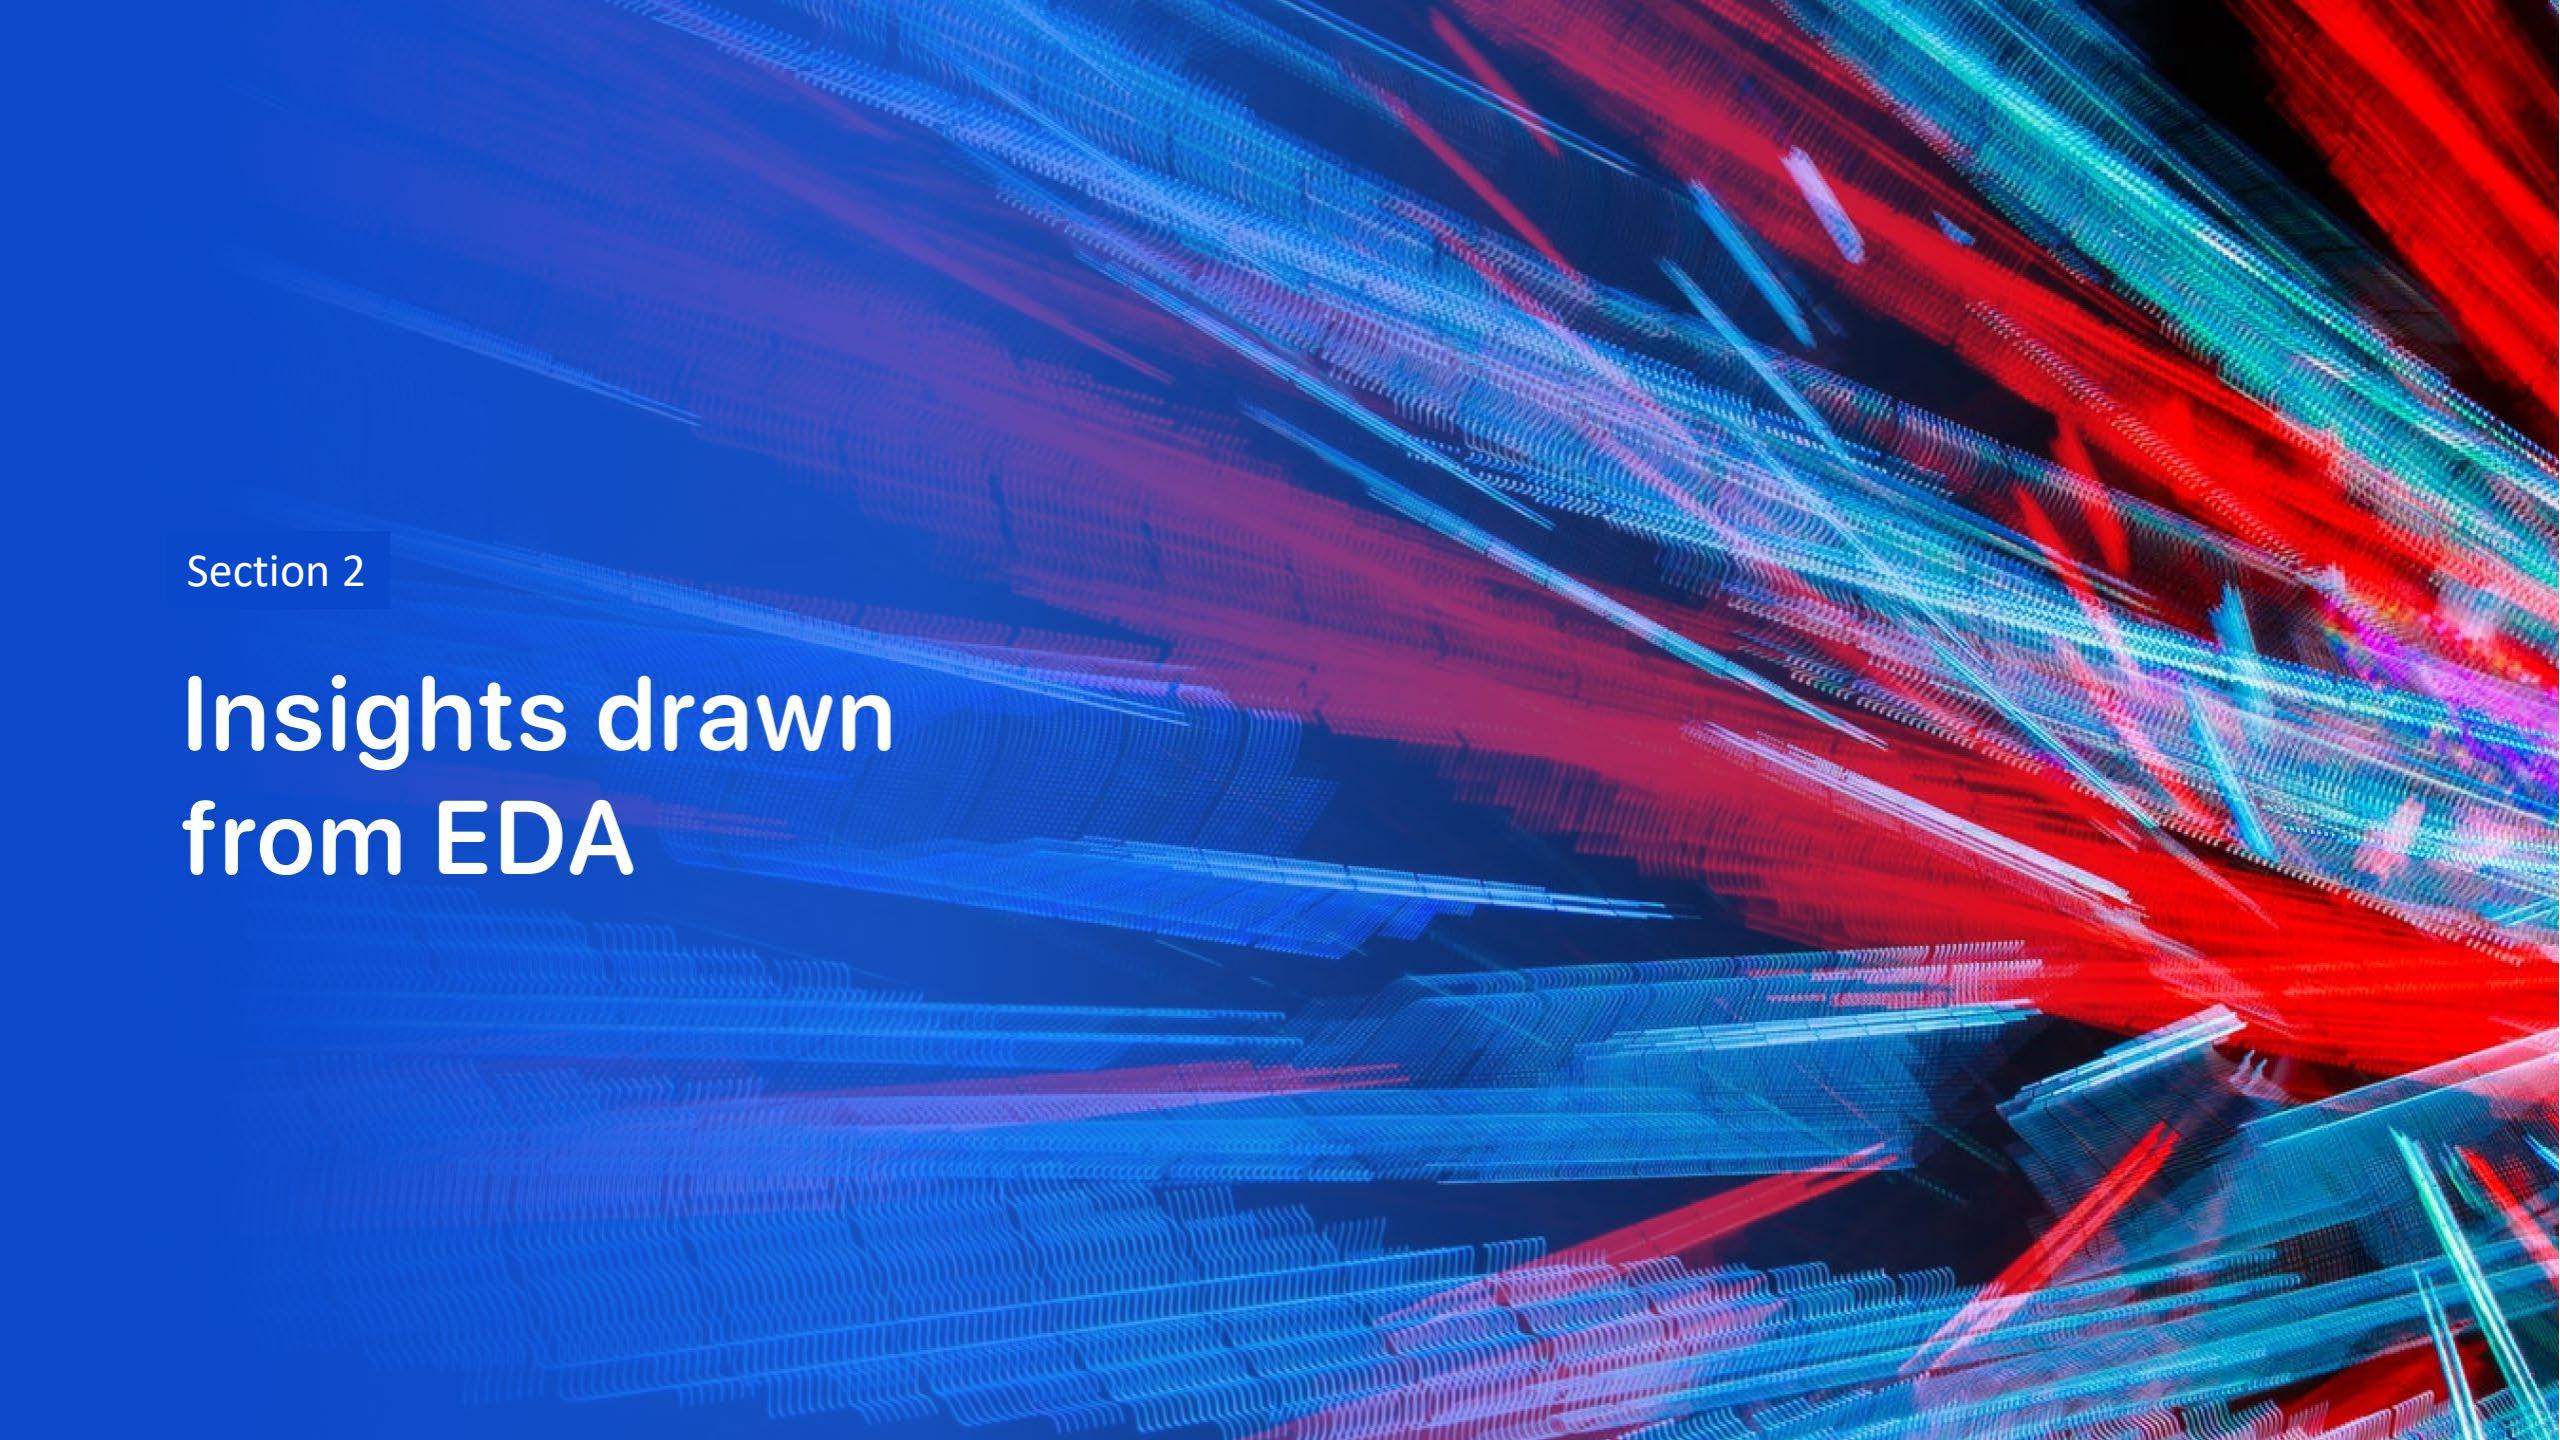

The accuracy of test data are calculated for each machine learning model. It is found that the methods performed best are LR, SVM, KNN and Decision Tree where all 4 achieved the highest accuracy of 83.33%.

Results

- LR, SVM, KNN are top-performing models for forecasting outcomes in this data.
- Lighter payloads have a higher performance compared to heavier ones.
- The likelihood of a SpaceX launch succeeding increases with the number of years of experience, suggesting a trend towards flawless launches over time.
- Launch Complex 39A at Kennedy Space Center has the highest number of successful launches compared to other launch sites.
- GEO,HEO,SSO,ES L1 orbit types exhibit the highest rates of successful launches.

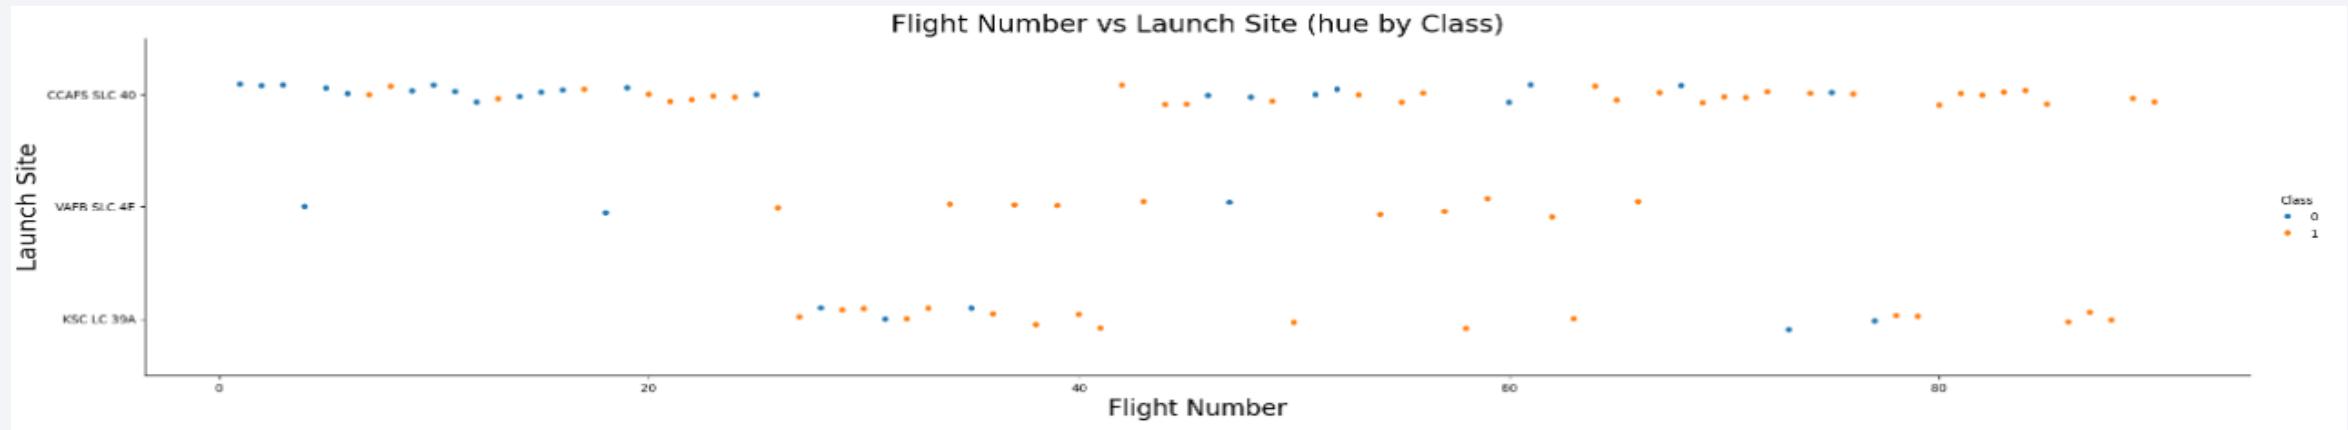

The background of the slide features a complex, abstract digital visualization. It consists of numerous thin, glowing lines that create a sense of depth and motion. The lines are primarily blue and red, with some green and purple highlights. They form a grid-like structure that curves and twists across the frame, resembling a three-dimensional space or a network of data points. The overall effect is futuristic and dynamic.

Section 2

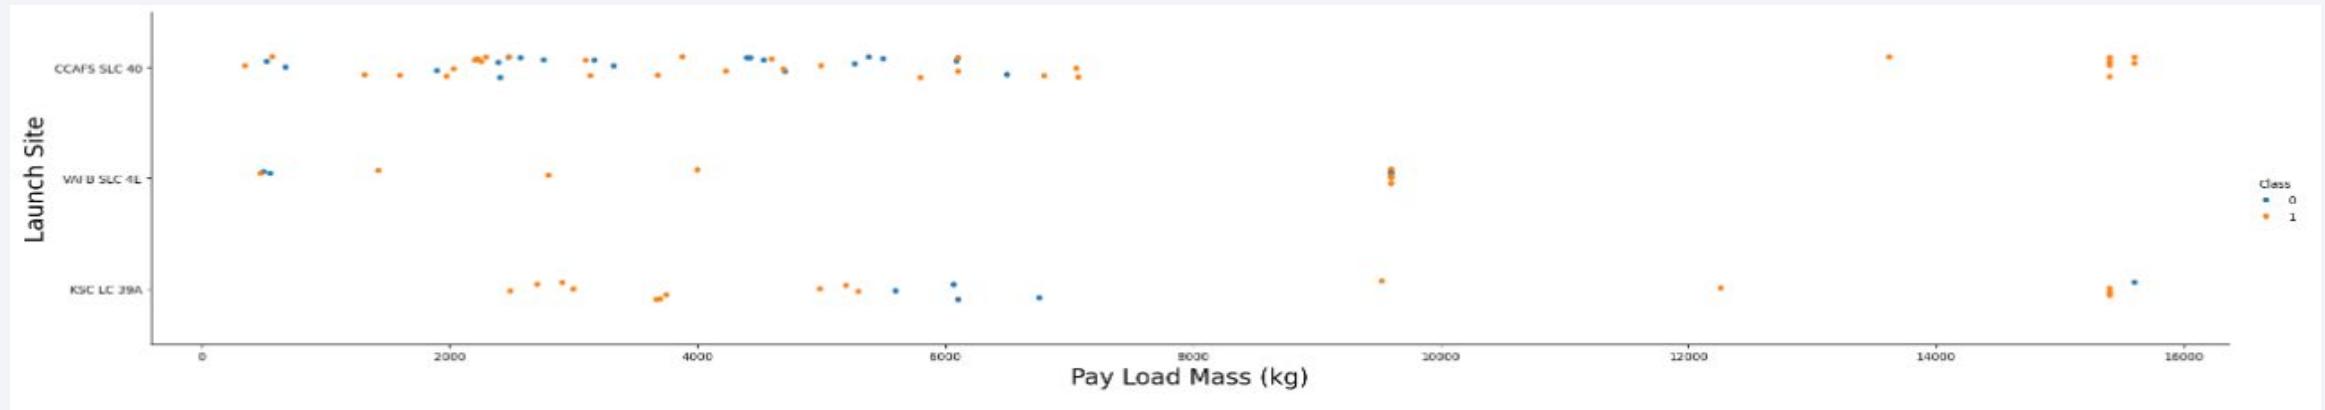

Insights drawn from EDA

Flight Number vs. Launch Site

Total number of launches from launch site CCAFS SLC 40 are significantly higher than the other launch sites.

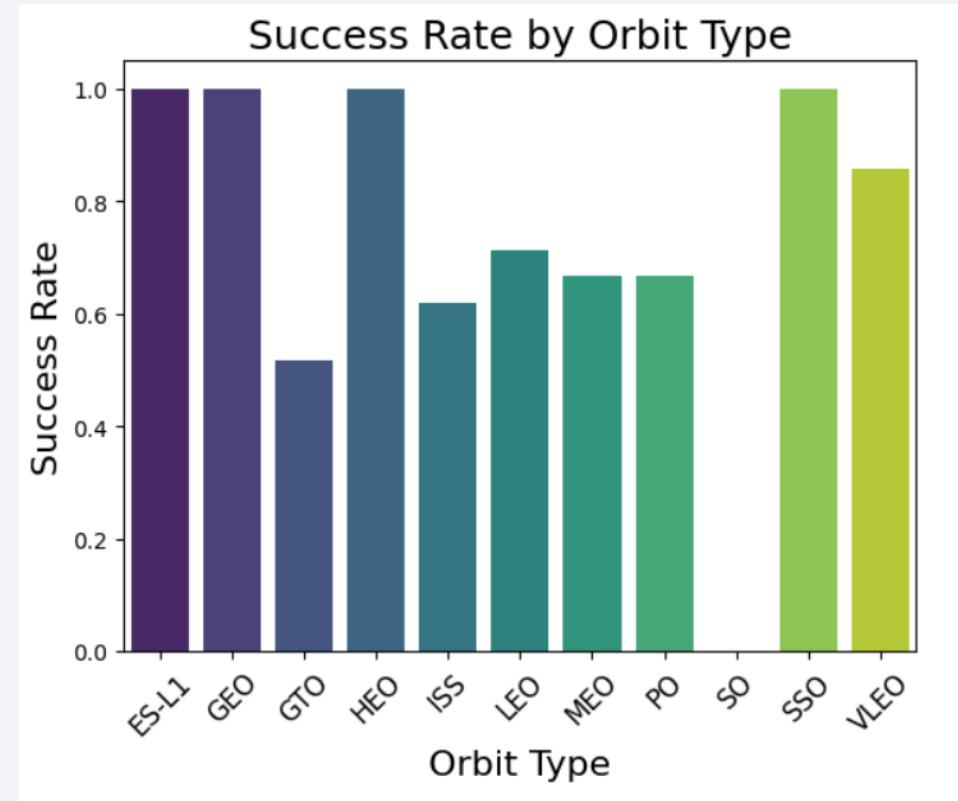

Payload vs. Launch Site

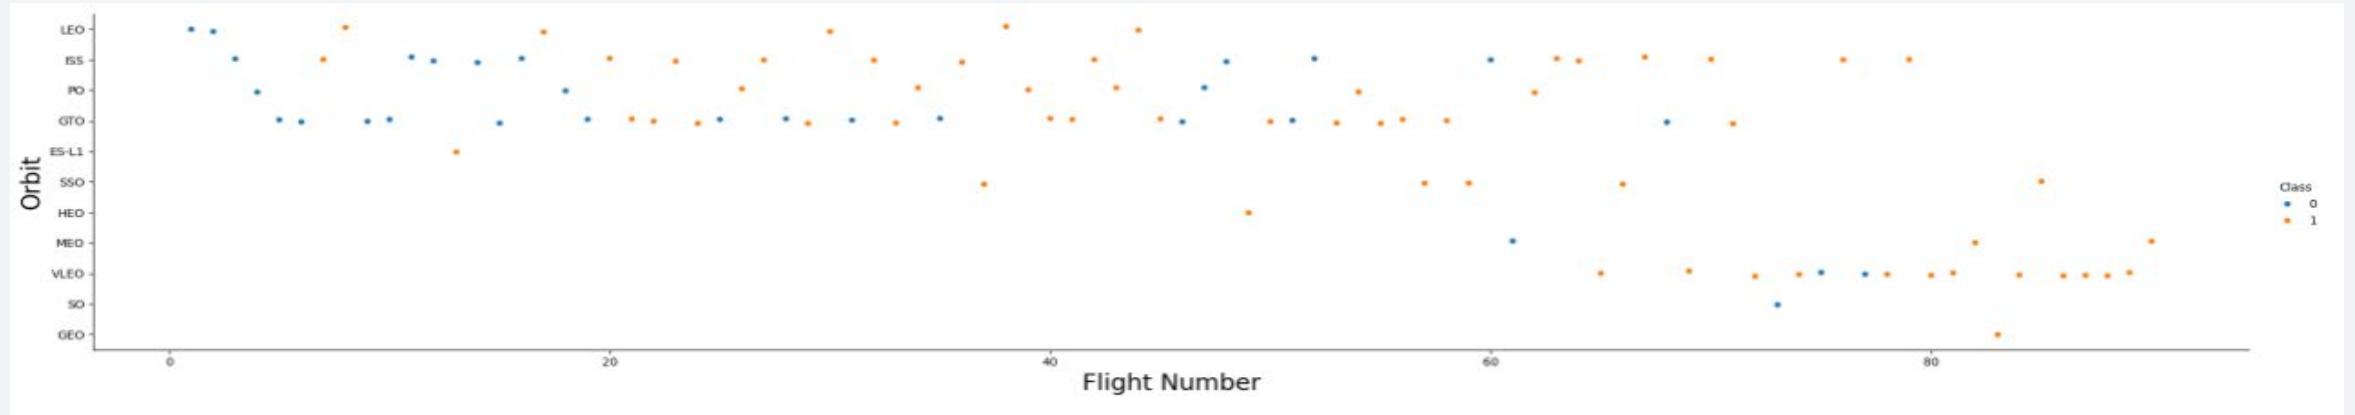

Payloads with lower mass are have more launches compared to those with higher mass across all three launch sites.

Success Rate vs. Orbit Type

Orbit types ES-L1, GEO, HEO, SSO have the highest success rate among all.

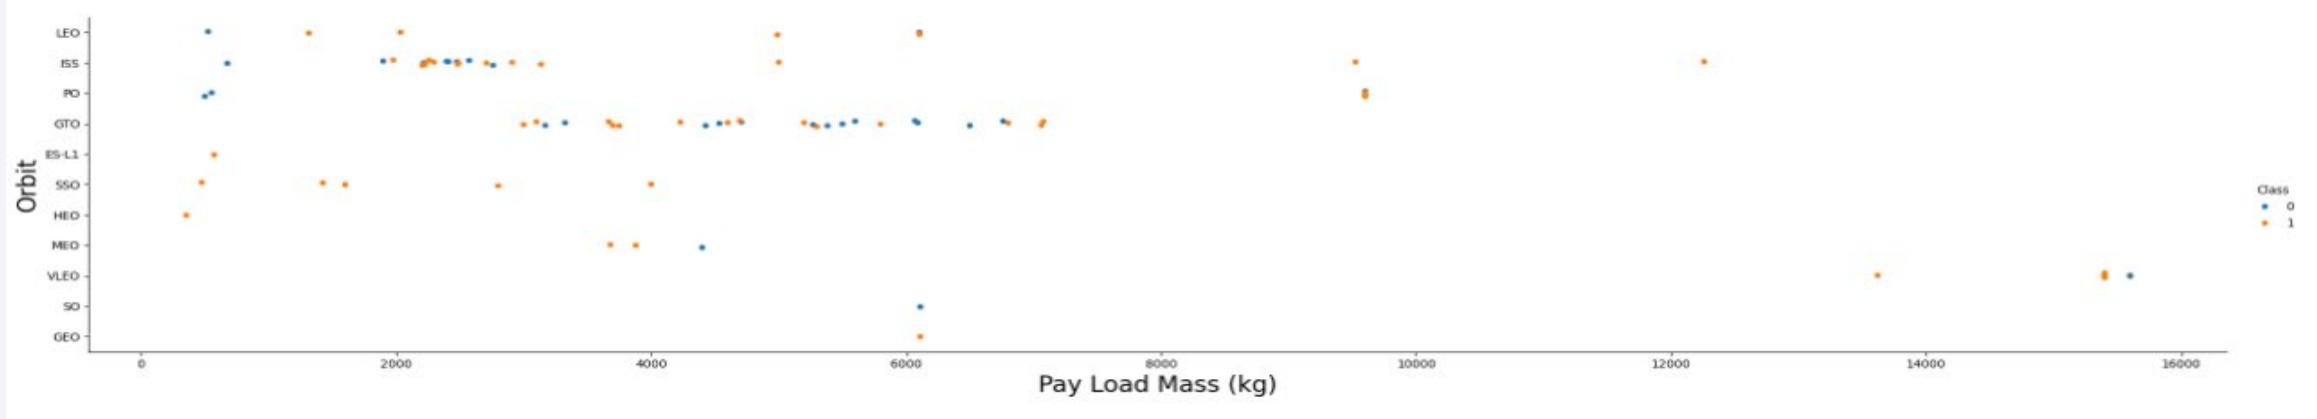

Flight Number vs. Orbit Type

LEO, ISS, PO, GTO orbits have the most launches in the earlier years, but it slowly shifted to VLEO orbit in the later years.

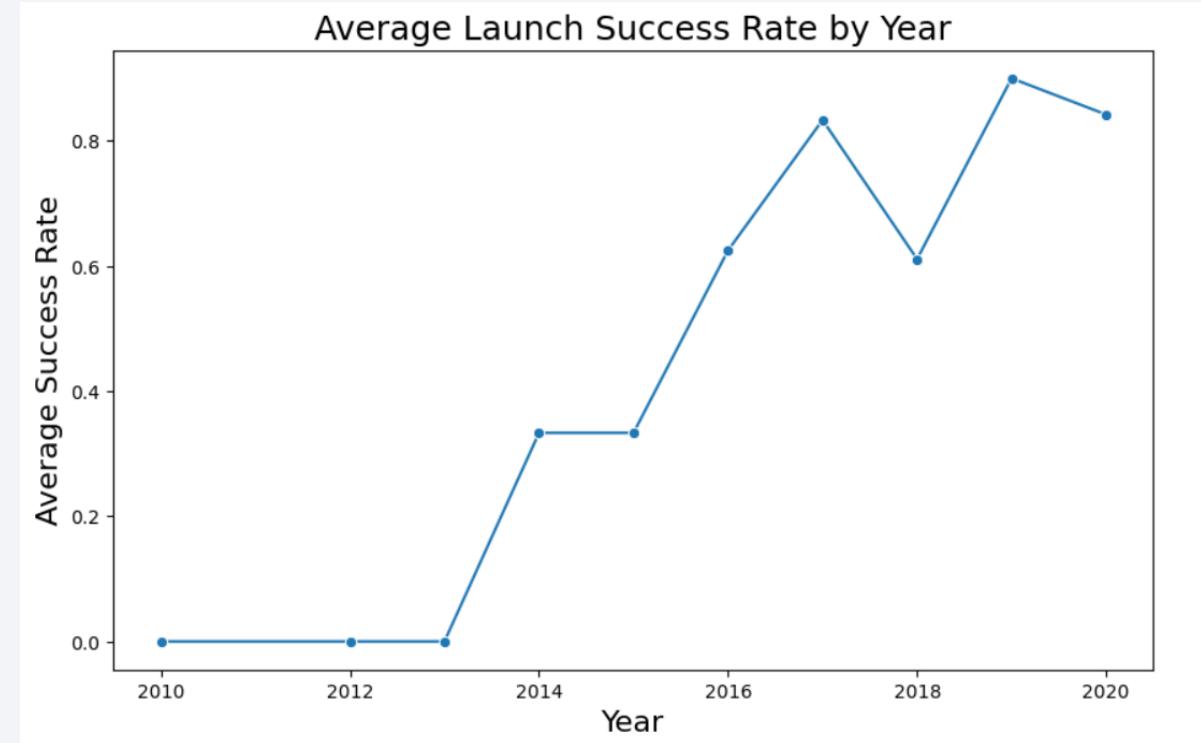

Payload vs. Orbit Type

Heavy payloads tend to have higher successful landing rates for PO, LEO, and ISS orbits, but for GTO orbit, success is less predictable with an almost equal mix of successes and failures.

Launch Success Yearly Trend

The success rate of launches have been increasing since 2013 till 2020, possibly due to technology advancement and experience.

All Launch Site Names

Performed an SQL query to obtain all launch site names.

Task 1

Display the names of the unique launch sites in the space mission

```
]: %sql SELECT DISTINCT LAUNCH_SITE FROM SPACEXTBL ORDER BY 1;
```

```
* sqlite:///my_data1.db
```

```
Done.
```

```
]: Launch_Site
```

```
CCAFS LC-40
```

```
CCAFS SLC-40
```

```
KSC LC-39A
```

```
VAFB SLC-4E
```

Launch Site Names Begin with 'CCA'

Performed an SQL query to obtain 5 launch site names that begin with 'CCA'.

Task 2

Display 5 records where launch sites begin with the string 'CCA'

```
%sql SELECT * FROM SPACEXTBL WHERE LAUNCH_SITE LIKE 'CCA%' LIMIT 5;
```

```
* sqlite:///my_data1.db
```

```
Done.
```

Date	Time (UTC)	Booster_Version	Launch_Site	Payload	PAYLOAD_MASS_KG_	Orbit	Customer	Mission_Outcome	Landing_Outcome
04-06-2010	18:45:00	F9 v1.0 B0003	CCAFS LC-40	Dragon Spacecraft Qualification Unit	0	LEO	SpaceX	Success	Failure (parachute)
08-12-2010	15:43:00	F9 v1.0 B0004	CCAFS LC-40	Dragon demo flight C1, two CubeSats, barrel of Brouere cheese	0	LEO (ISS)	NASA (COTS) NRO	Success	Failure (parachute)
22-05-2012	07:44:00	F9 v1.0 B0005	CCAFS LC-40	Dragon demo flight C2	525	LEO (ISS)	NASA (COTS)	Success	No attempt
08-10-2012	00:35:00	F9 v1.0 B0006	CCAFS LC-40	SpaceX CRS-1	500	LEO (ISS)	NASA (CRS)	Success	No attempt
01-03-2013	15:10:00	F9 v1.0 B0007	CCAFS LC-40	SpaceX CRS-2	677	LEO (ISS)	NASA (CRS)	Success	No attempt

Total Payload Mass

Task 3

Display the total payload mass carried by boosters launched by NASA (CRS)

In [17]: `%sql select sum(PAYLOAD_MASS__KG_) from SPACEXTABLE where customer = 'NASA (CRS)'`

* sqlite:///my_data1.db
Done.

Out[17]: `sum(PAYLOAD_MASS__KG_)`

45596

Performed an SQL query to obtain the total payload mass carried by boosters launched by NASA (CRS)

Average Payload Mass by F9 v1.1

Task 4

Display average payload mass carried by booster version F9 v1.1

```
In [18]: %sql select avg(PAYLOAD_MASS__KG_) from SPACEXTABLE where Booster_Version = 'F9 v1.1'  
* sqlite:///my_data1.db  
Done.  
Out[18]: avg(PAYLOAD_MASS__KG_)  
2928.4
```

Performed an SQL query to calculate the average payload mass carried by booster version F9 v1.1

First Successful Ground Landing Date

Task 5

List the date when the first succesful landing outcome in ground pad was acheived.

Hint:Use min function

In [21]:

```
%%sql
SELECT min(Date)
FROM SPACEXTBL
WHERE Landing_Outcome = 'Success (ground pad)';
```

```
* sqlite:///my_data1.db
Done.
```

Out[21]:

min(Date)

2015-12-22

Performed an SQL query to find the dates of the first successful landing outcome on ground pad.

The dates of the first successful landing outcome on ground pad was 22ndDecember 2015.

Successful Drone Ship Landing with Payload between 4000 and 6000

Task 6

List the names of the boosters which have success in drone ship and have payload mass greater than 4000 but less than 6000

```
In [22]: %sql select distinct Booster_Version from SPACEXTABLE where Landing_Outcome = 'Success (drone ship)' and PAYLOAD_
* sqlite:///my_data1.db
Done.
```

```
Out[22]: Booster_Version
F9 FT B1022
F9 FT B1026
F9 FT B1021.2
F9 FT B1031.2
```

Performed an SQL query to list the names of boosters which have successfully landed on drone ship and had payload mass greater than 4000 but less than 6000

Total Number of Successful and Failure Mission Outcomes

Task 7

List the total number of successful and failure mission outcomes

In [23]: `%sql select distinct Mission_Outcome, count(*) from SPACEXTABLE group by Mission_Outcome`

* sqlite:///my_data1.db
Done.

Out [23]:

Mission_Outcome	count(*)
Failure (in flight)	1
Success	98
Success	1
Success (payload status unclear)	1

Performed an SQL query to calculate the total number of successful and failure mission outcomes.

Boosters Carried Maximum Payload

Task 8

List the names of the booster_versions which have carried the maximum payload mass. Use a subquery

```
In [25]: %sql select Booster_Version from SPACEXTABLE where PAYLOAD_MASS_KG_ = (select max(PAYLOAD_MASS_KG_)from SPACEXTABLE)
* sqlite:///my_data1.db
Done.
```

```
Out[25]: Booster_Version
F9 B5 B1048.4
F9 B5 B1049.4
F9 B5 B1051.3
F9 B5 B1056.4
F9 B5 B1048.5
F9 B5 B1051.4
F9 B5 B1049.5
F9 B5 B1060.2
F9 B5 B1058.3
F9 B5 B1051.6
F9 B5 B1060.3
F9 B5 B1049.7
```

```
%sql select Booster_Version from SPACEXTABLE where PAYLOAD_MASS_KG_ = (select max(PAYLOAD_MASS_KG_)from SPACEXTABLE)
```

Performed an SQL query to list the names of the booster which have carried the maximum payload mass.

2015 Launch Records

Task 9

List the records which will display the month names, failure landing_outcomes in drone ship ,booster versions, launch_site for the months in year 2015.

Note: SQLite does not support monthnames. So you need to use substr(Date, 6,2) as month to get the months and substr(Date,0,5)='2015' for year.

In [26]: `%sql select substr(Date, 6,2) as Month, Landing_Outcome, Booster_Version, Launch_Site from SPACEXTABLE where La`

* sqlite:///my_data1.db
Done.

Out [26]:

Month	Landing_Outcome	Booster_Version	Launch_Site
01	Failure (drone ship)	F9 v1.1 B1012	CCAFS LC-40
04	Failure (drone ship)	F9 v1.1 B1015	CCAFS LC-40

```
%sql select substr(Date, 6,2) as Month, Landing_Outcome, Booster_Version, Launch_Site from SPACEXTABLE where Landing_Outcome = 'Failure (drone ship)' and substr(Date,0,5) = '2015'
```

Performed an SQL query to list the failed landing outcomes in drone ship, their booster versions, and launch site names for in year 2015.

Rank Landing Outcomes Between 2010-06-04 and 2017-03-20

Task 10

Rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad)) between the date 2010-06-04 and 2017-03-20, in descending order.

In [27]:

```
%sql select Landing_Outcome, count(*) as 'Count' from SPACEXTABLE where Date between '2010-06-04' and '2017-03-20'
```

```
* sqlite:///my_data1.db  
Done.
```

Out[27]:

Landing_Outcome	Count
No attempt	10
Success (drone ship)	5
Failure (drone ship)	5
Success (ground pad)	3
Controlled (ocean)	3
Uncontrolled (ocean)	2
Failure (parachute)	2
Precluded (drone ship)	1

Performed an SQL query to rank the count of landing outcomes (such as Failure (drone ship) or Success (ground pad)) between the date 2010-06-04 and 2017-03-20, in descending order.

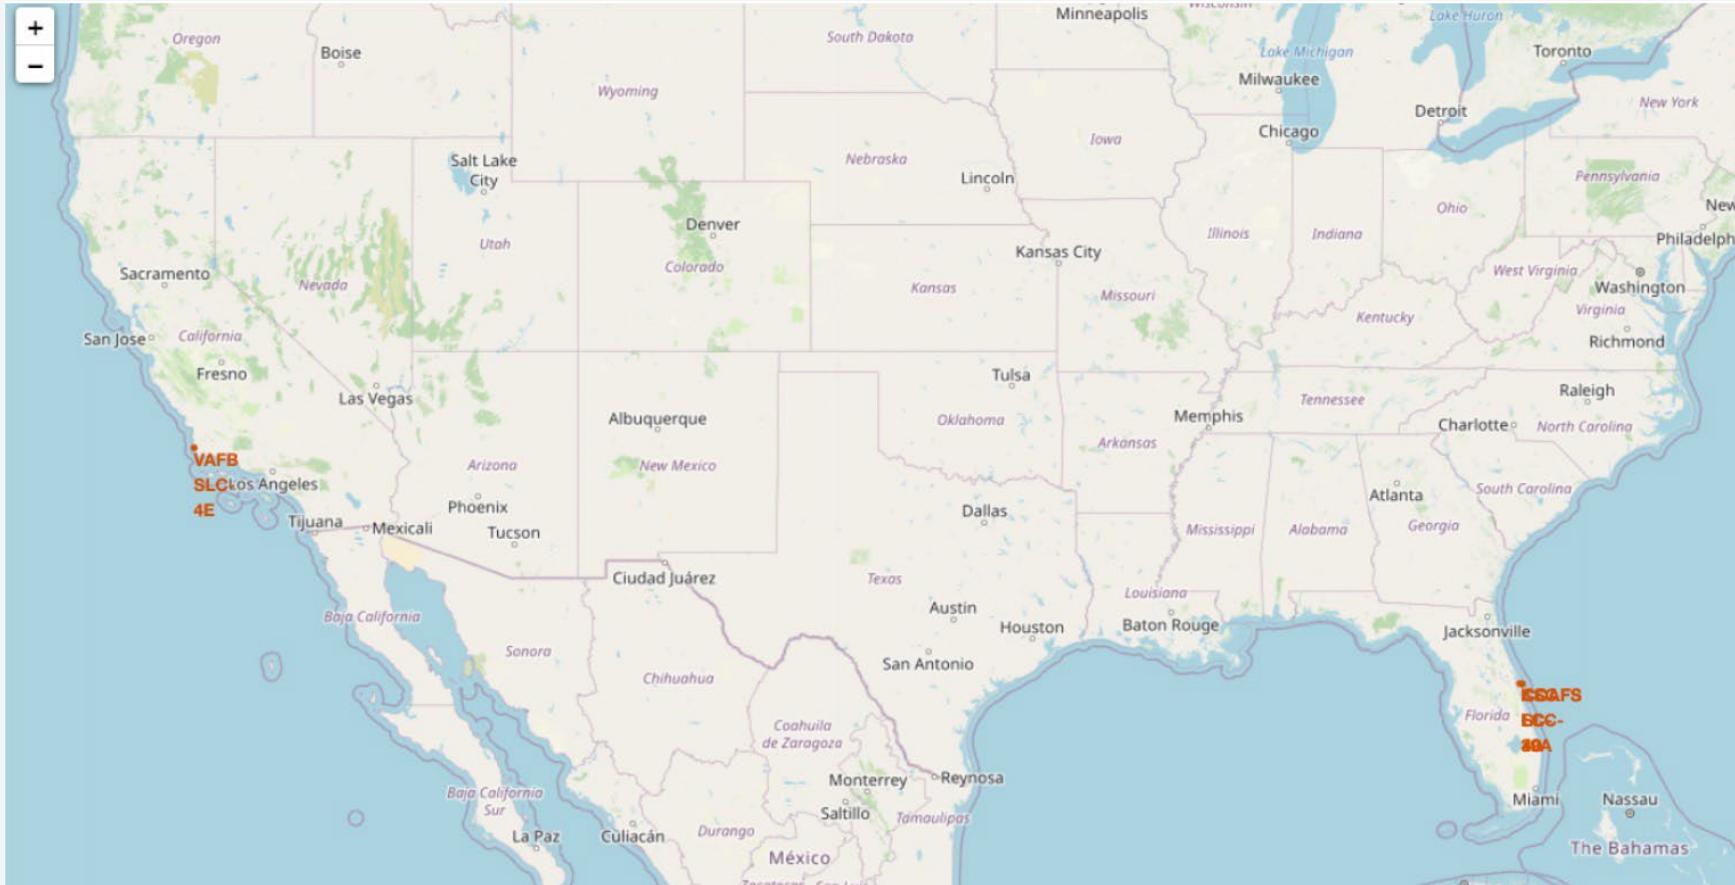

```
%sql select Landing_Outcome, count(*) as 'Count' from SPACEXTABLE where Date between '2010-06-04' and '2017-03-20' group by Landing_Outcome order by Count desc
```

The background of the slide is a photograph taken from space at night. It shows the curvature of the Earth against the dark void of space. City lights are visible as numerous small white and yellow dots, primarily concentrated in the lower right quadrant where the United States and Mexico would be. In the upper left quadrant, the green and blue glow of the aurora borealis (Northern Lights) is visible in the upper atmosphere.

Section 3

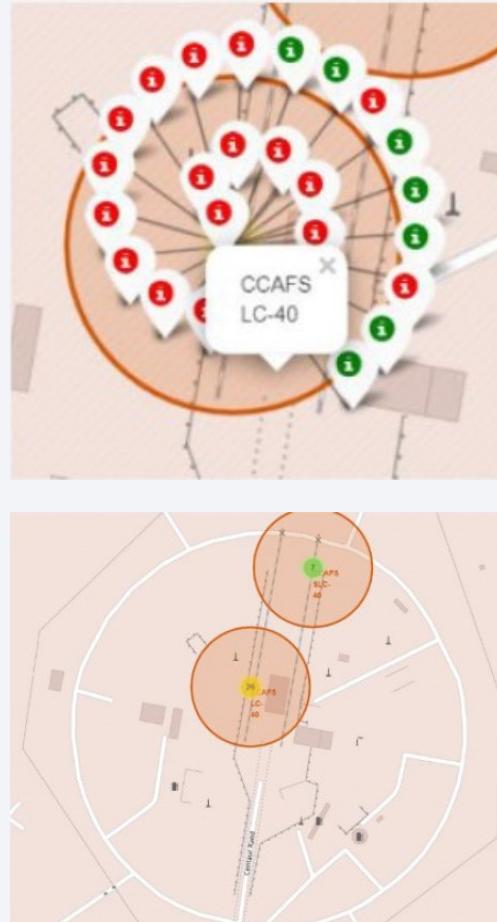

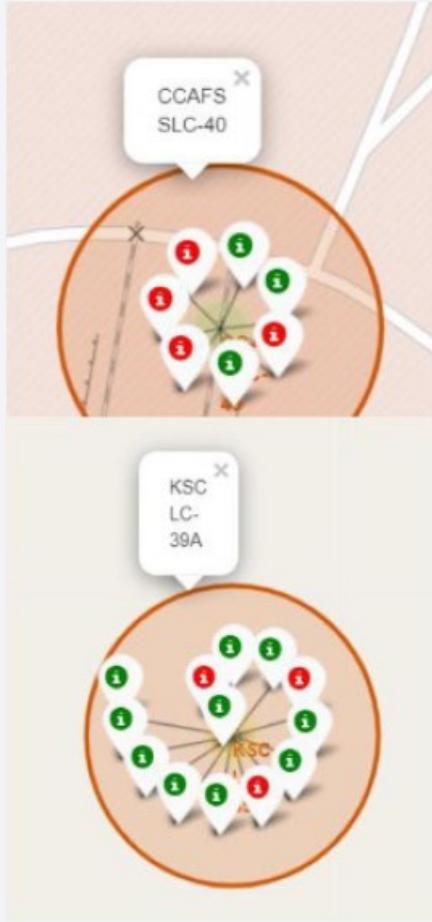

Launch Sites Proximities Analysis

All launch sites on a map

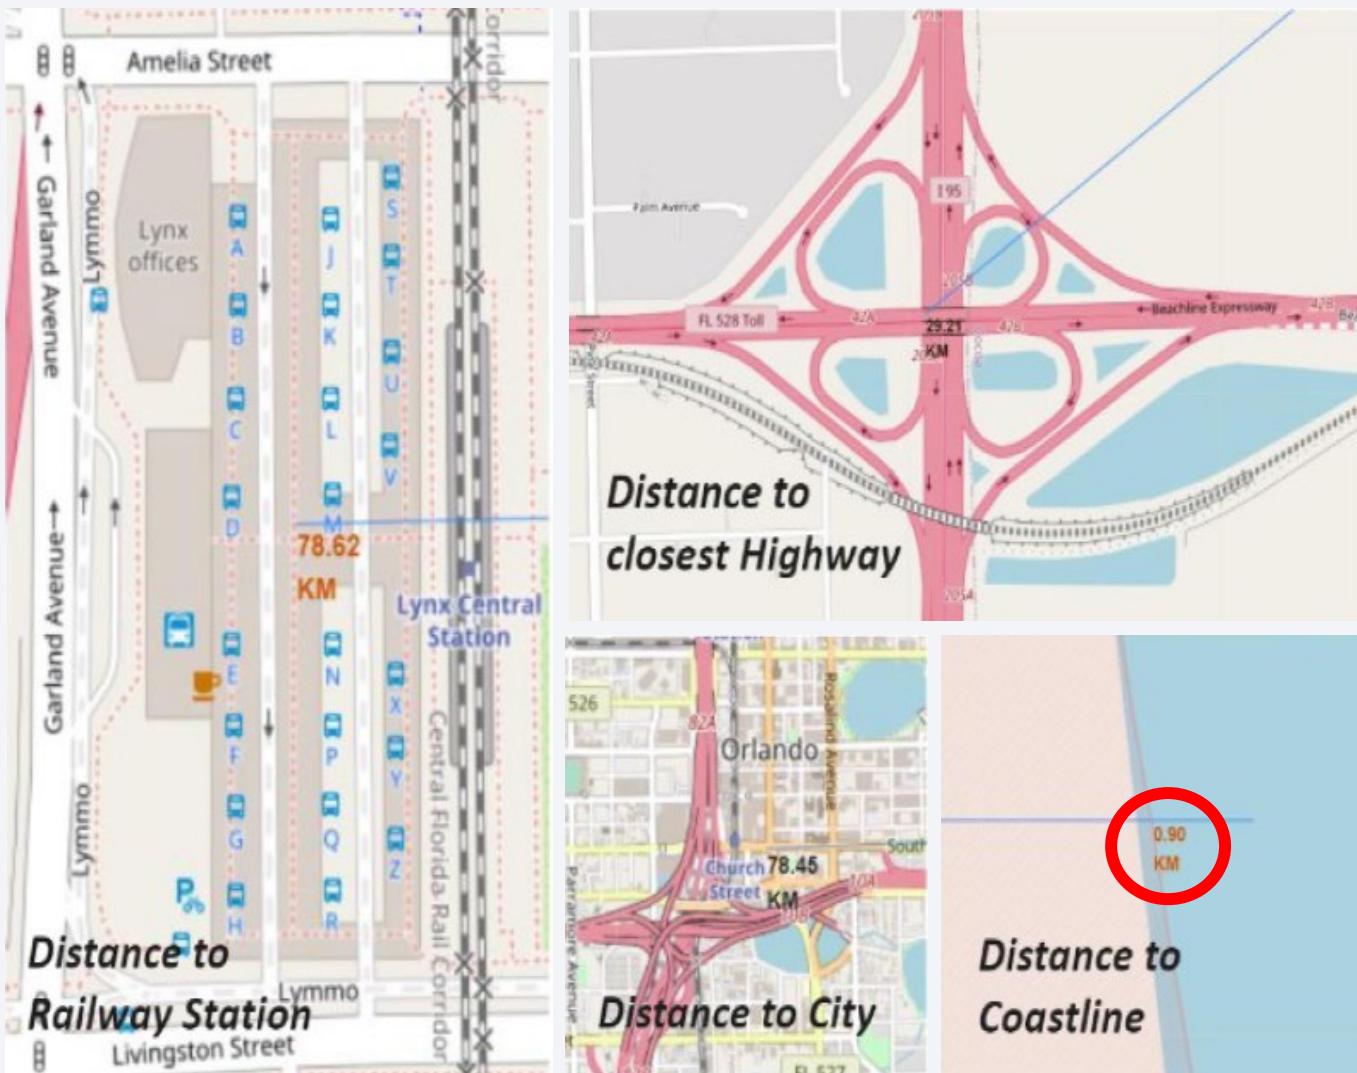

The launch sites are labelled by a marker with their names on the map.
The SpaceX launch sites are in California and Florida.

All success/failed launches for each site on the map

The launch records are grouped in clusters on the map, then labelled by green markers for successful launches, and red markers for Unsuccessful ones.

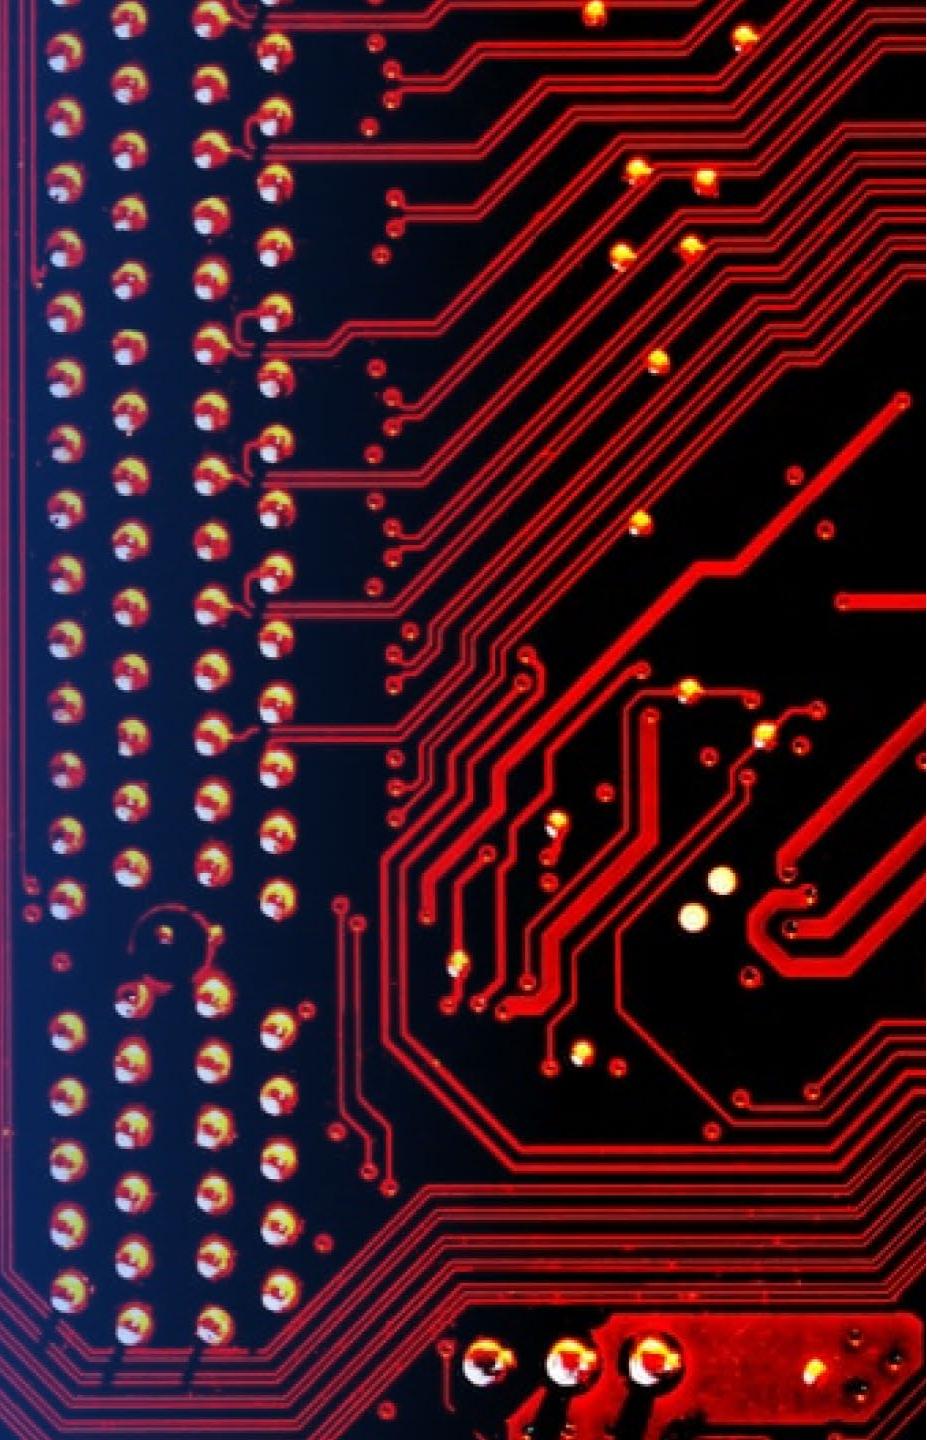

Launch Site distance to landmarks

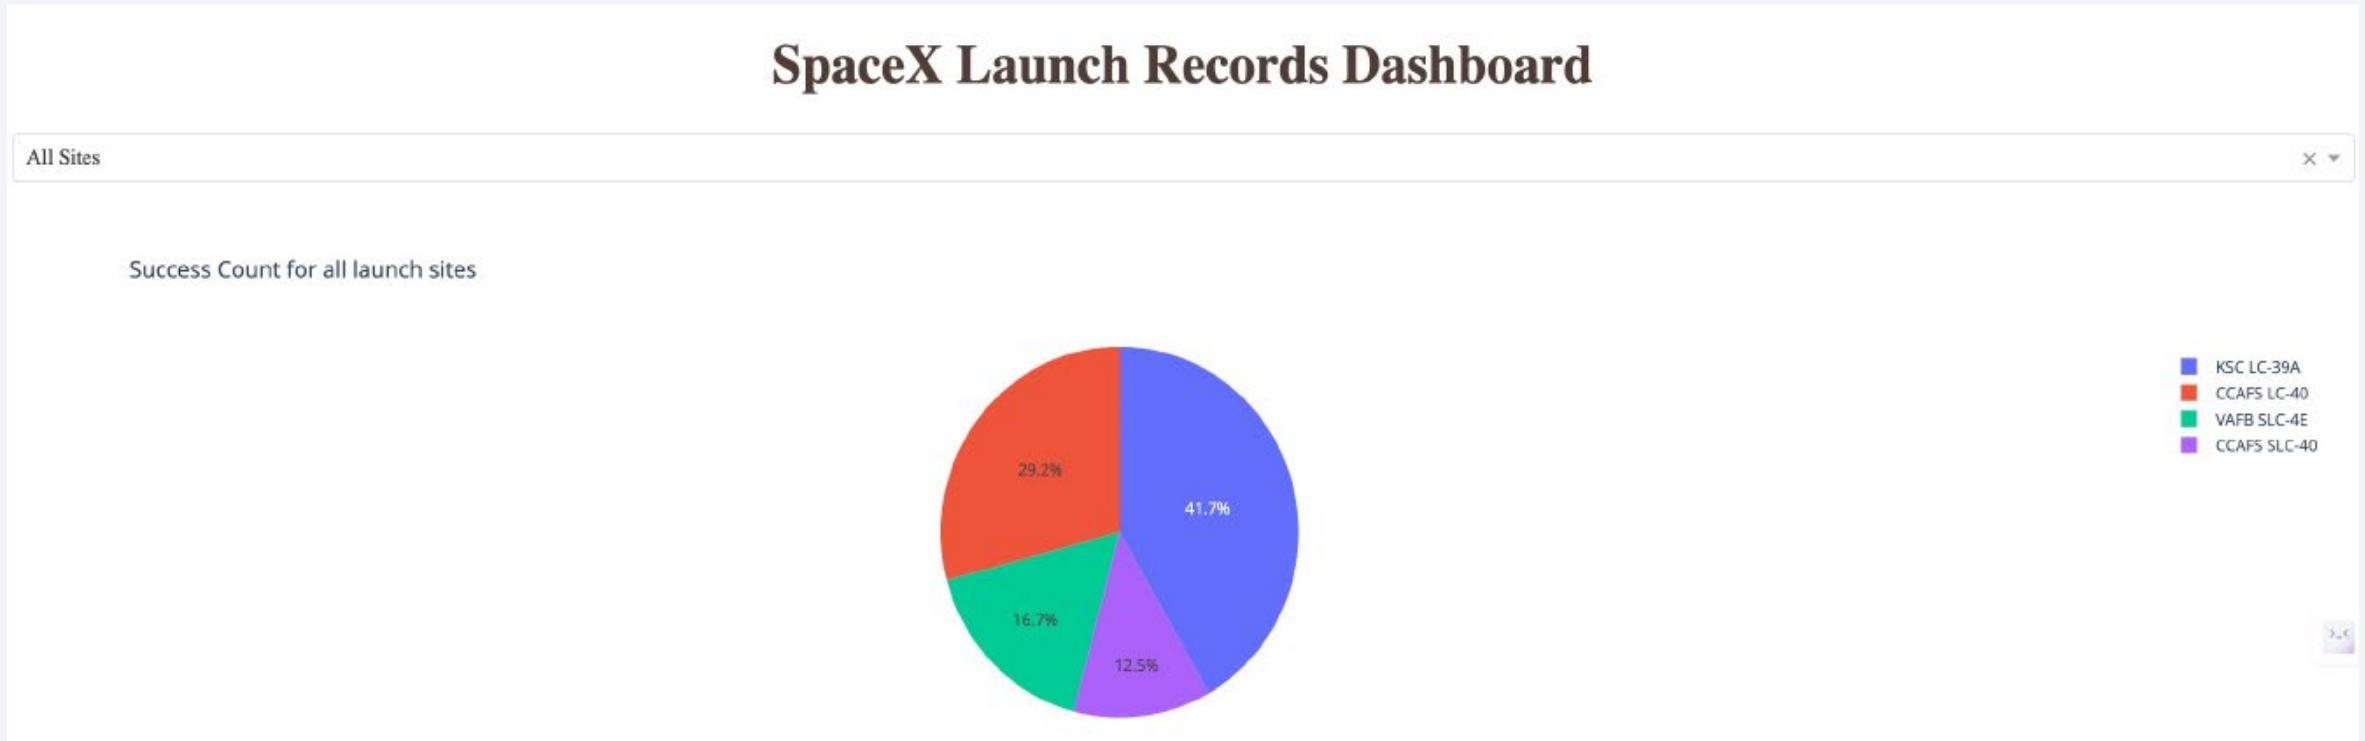

The closest coastline from NASA JSC is marked as a red point using MousePosition and the distance between the coastline point and the launch site, which is approximately 0.90km.

Section 4

Build a Dashboard with Plotly Dash

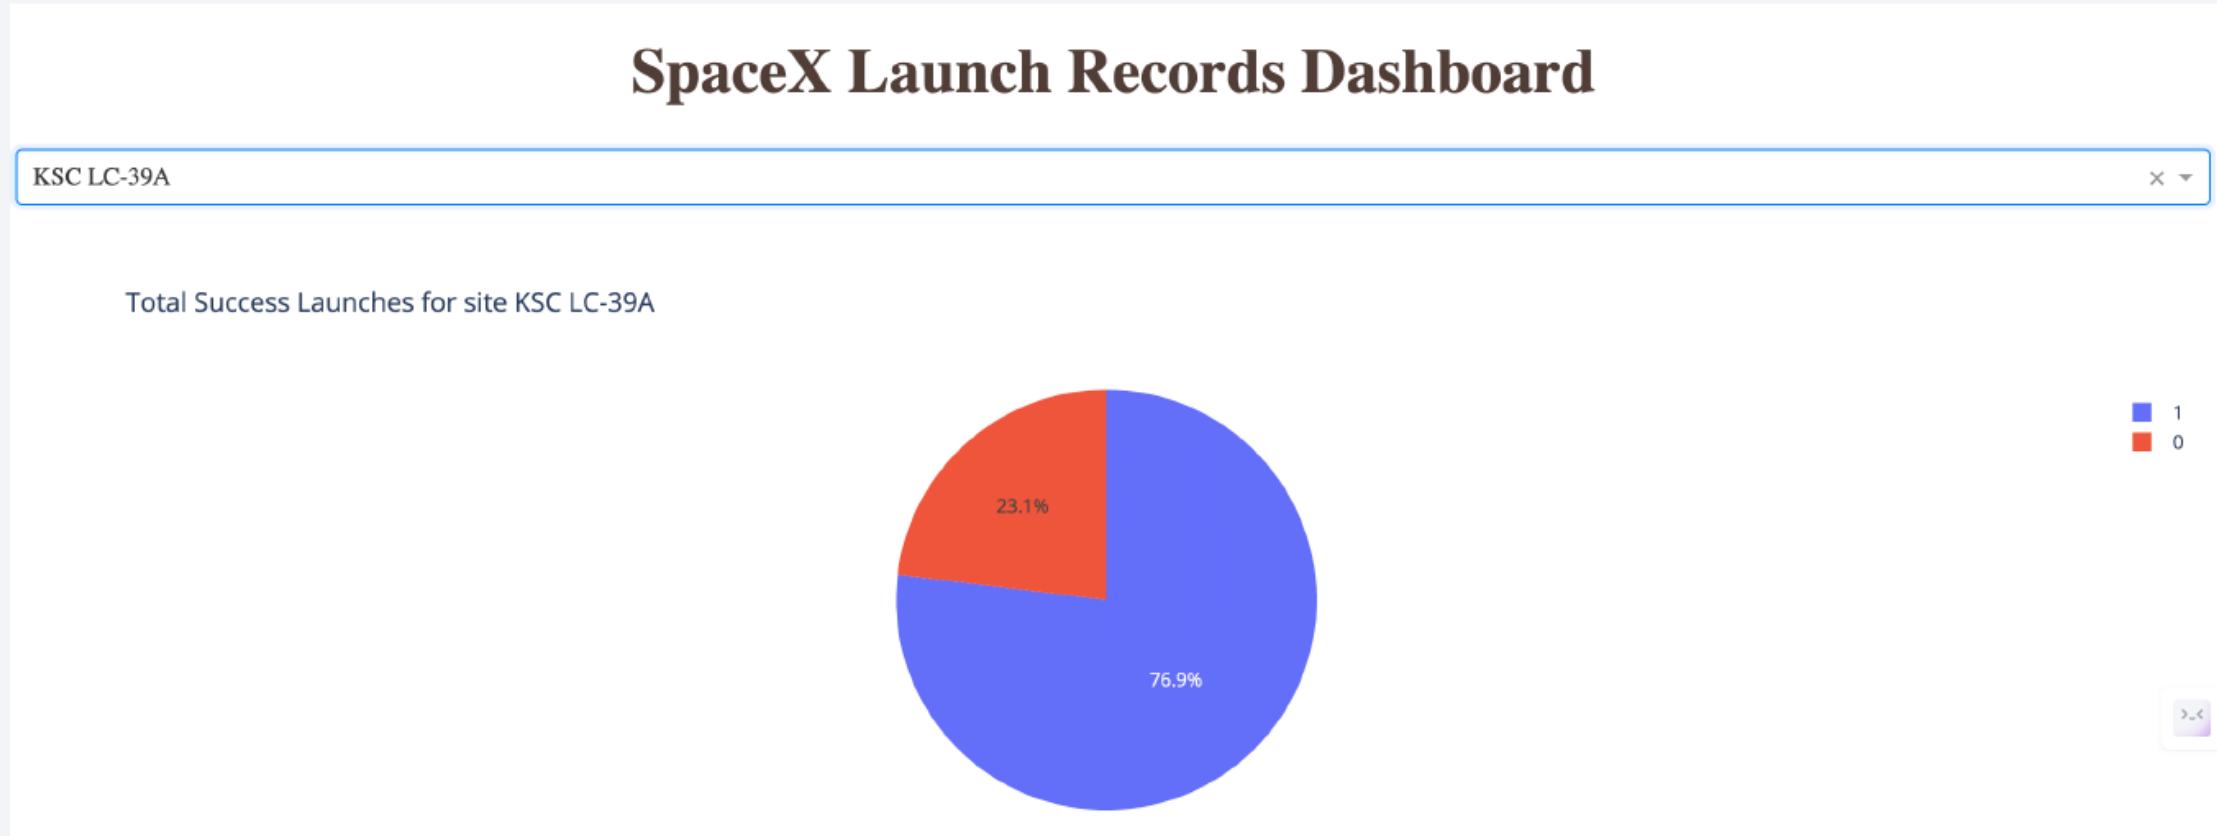

Pie chart showing the success percentage achieved by each launch site

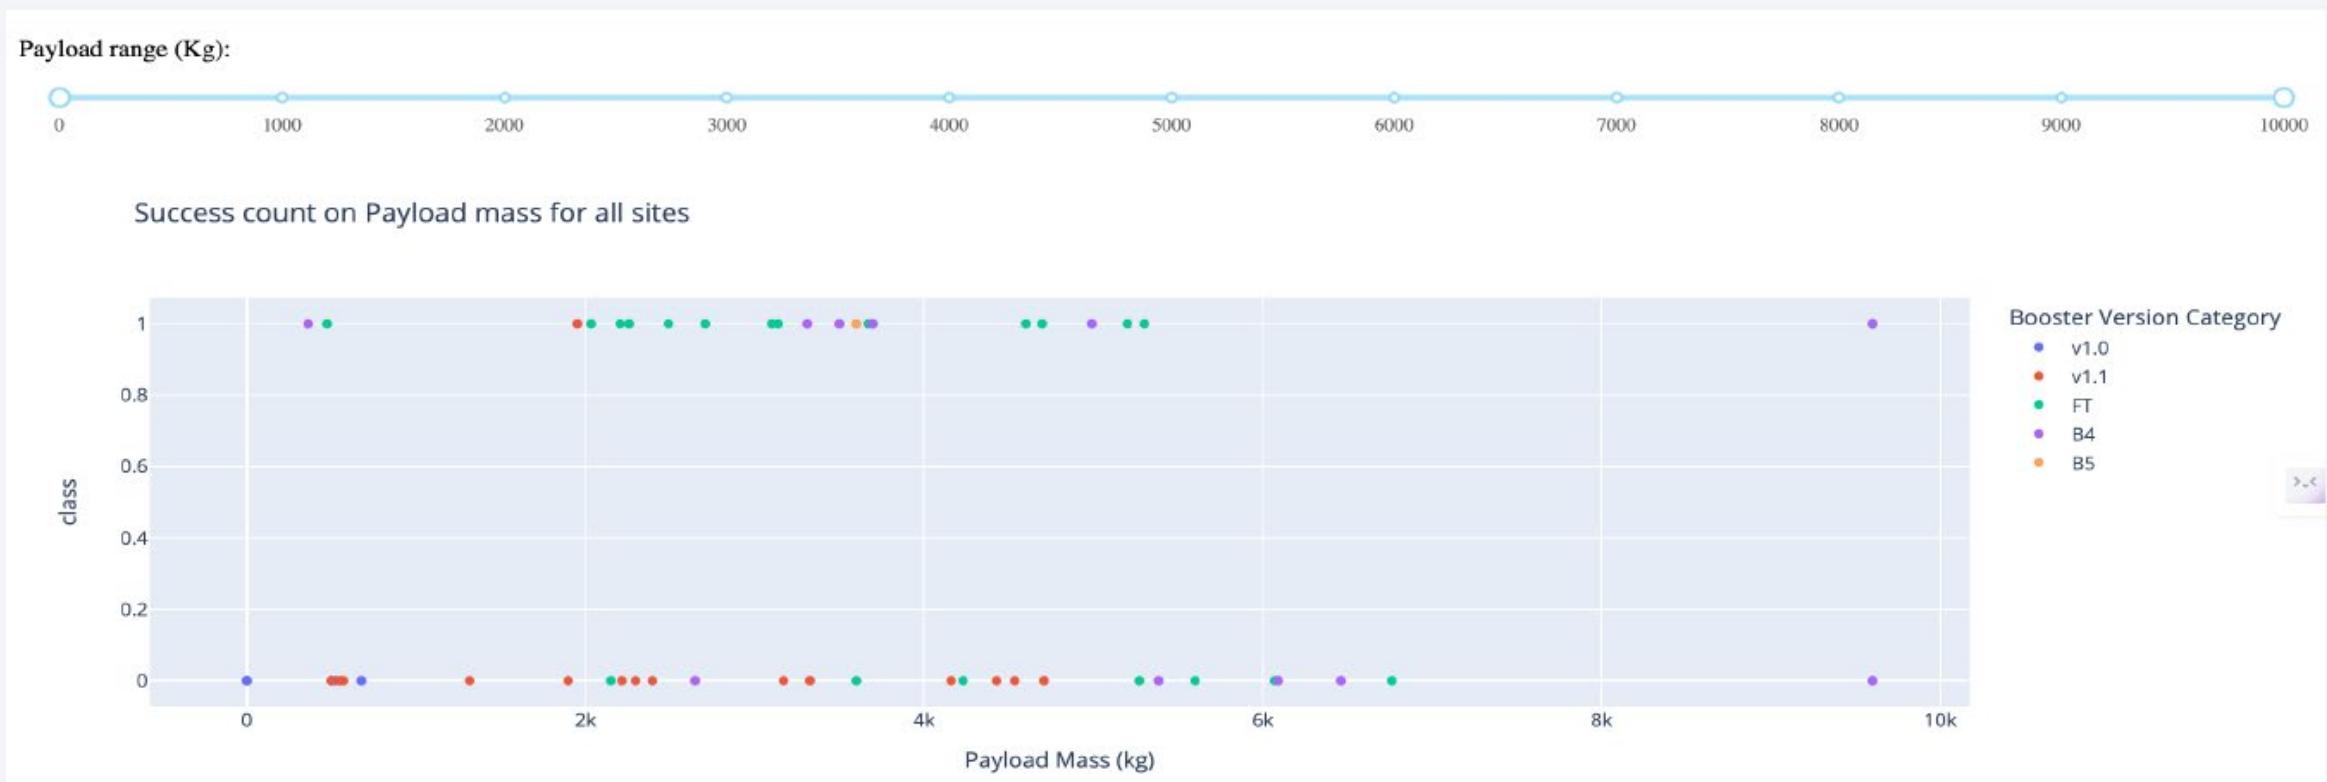

KSC LC-39A has the highest amount of success launches with 41.7% from the entire record, whereas CCAFS SLC-40 has the lowest amount of success launches with only 12.5%.

Success ratio of the launch site with the highest success launches

KSC LC-39A which is the launch site with highest amount of success, has a 76.9% success rate for the launches from its site, and 23.1% failure rate.

Payload vs. launch outcome

The payload range that has the highest success launches is between 2,000 to 4,000 kg, which can be seen by the most number of plots in that range, followed by the payload range of 4,000 to 6,000 kg, with the second most number of plots.

Booster version FT (green spots) has the highest success launches, followed by B4 (purple spots) with the second highest success launches, among all booster versions. 41

The background of the slide features a dynamic, abstract design. It consists of several thick, curved lines in shades of blue and yellow, creating a sense of motion and depth. The lines curve from the bottom left towards the top right, with some lines being more prominent than others. The overall effect is reminiscent of a tunnel or a high-speed journey through a digital space.

Section 5

Predictive Analysis (Classification)

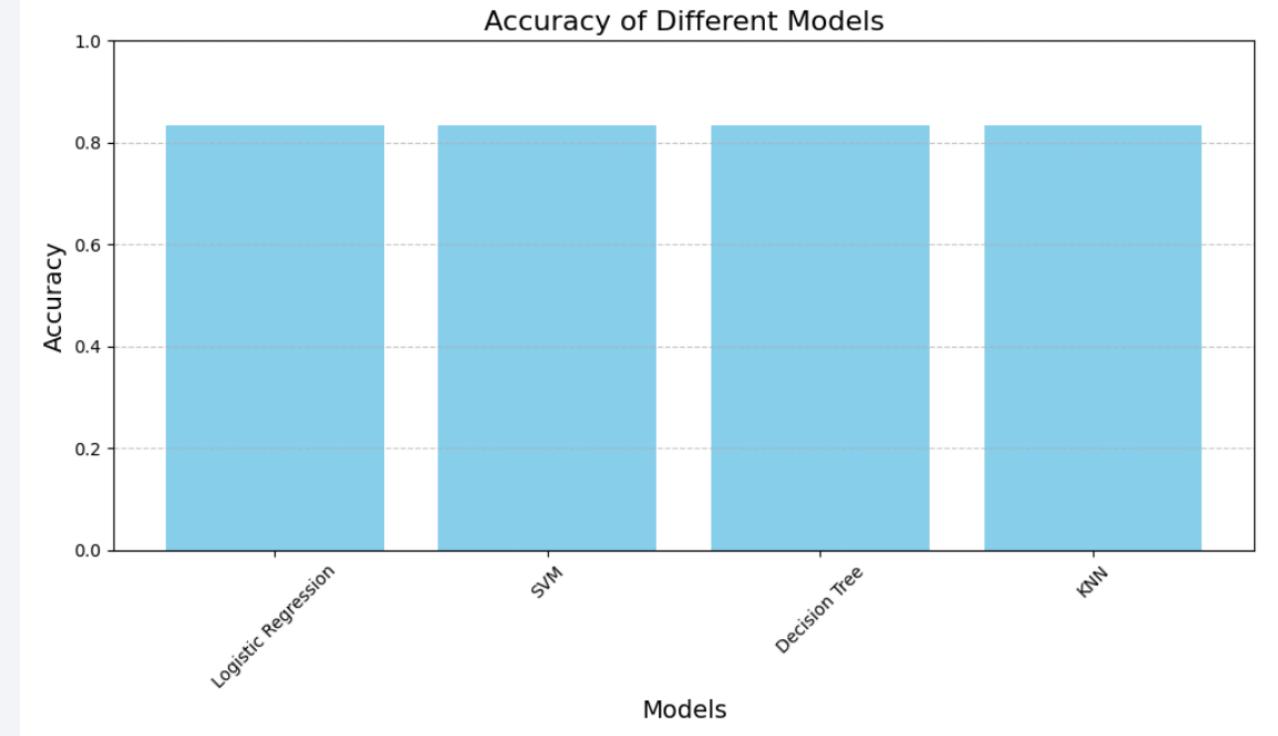

Classification Accuracy

Find the method performs best:

```
In [30]:  
print('LR Accuracy:', '{:.2%}'.format(logreg_accuracy))  
print('SVM Accuracy:', '{:.2%}'.format(svm_accuracy))  
print('Decision Tree Accuracy:', '{:.2%}'.format(tree_accuracy))  
print('KNN Accuracy:', '{:.2%}'.format(knn_accuracy))
```

```
LR Accuracy: 83.33%  
SVM Accuracy: 83.33%  
Decision Tree Accuracy: 83.33%  
KNN Accuracy: 83.33%
```

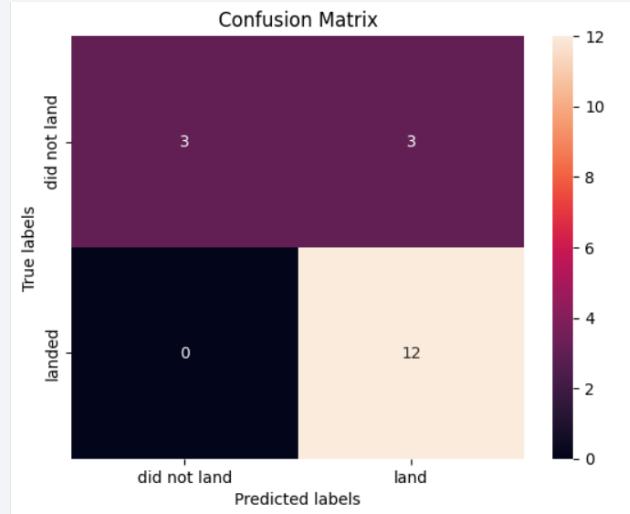

```
In [31]:  
import matplotlib.pyplot as plt  
  
# Accuracy values  
accuracies = [logreg_accuracy, svm_accuracy, tree_accuracy, knn_accuracy]  
models = ['Logistic Regression', 'SVM', 'Decision Tree', 'KNN']  
  
# Plotting  
plt.figure(figsize=(10, 6))  
plt.bar(models, accuracies, color='skyblue')  
plt.xlabel('Models', fontsize=14)  
plt.ylabel('Accuracy', fontsize=14)  
plt.title('Accuracy of Different Models', fontsize=16)  
plt.ylim(0, 1) # Set y-axis limit from 0 to 1 for percentage accuracy  
plt.grid(axis='y', linestyle='--', alpha=0.7)  
plt.xticks(rotation=45) # Rotate x-axis labels for better readability  
plt.tight_layout()  
plt.show()
```

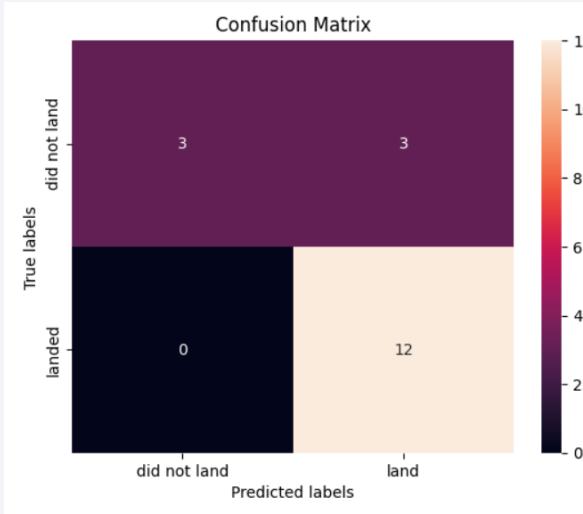

The model that performed best are LR, SVM, KNN and Decision Tree where all 4 achieved the highest accuracy of 83.33%.

Confusion Matrix

Confusion Matrix of LR

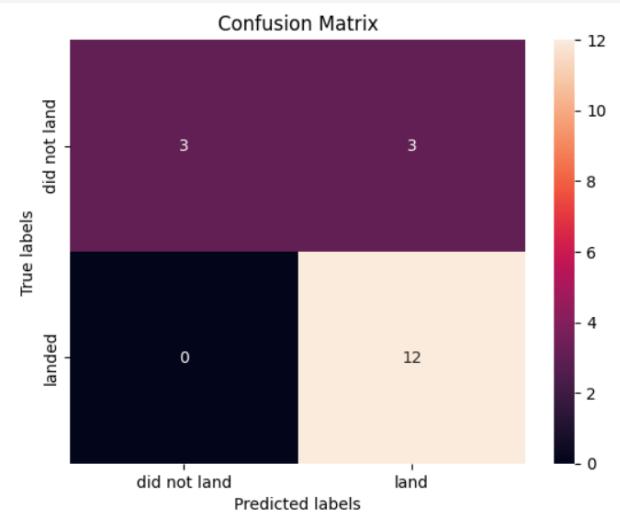

Confusion Matrix of SVM

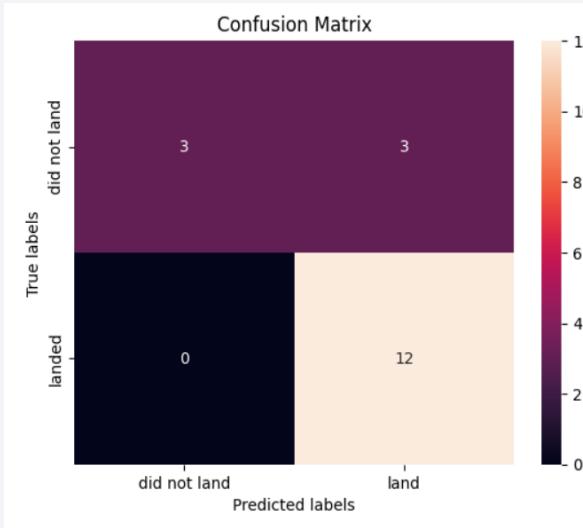

- LR, SVM, KNN and Decision Tree models are good as their confusion matrix show that they predicted all 12 successful landing correctly, with 0 error.

- LR, SVM, KNN and Decision Tree models have the same accuracy of 83.33% as displayed earlier, hence the same confusion matrix.

Confusion Matrix of Decision Tree

Confusion Matrix of KNN

Conclusions

- LR, SVM, KNN are top-performing models for forecasting outcomes in this data.
- Lighter payloads have a higher performance compared to heavier ones.
- The likelihood of a SpaceX launch succeeding increases with the number of years of experience, suggesting a trend towards flawless launches over time.
- Launch Complex 39A at Kennedy Space Center has the highest number of successful launches compared to other launch sites.
- GEO,HEO,SSO,ES L1 orbit types exhibit the highest rates of successful launches.

Thank you!
